THE STORY OF THE MINE.

CHAPTER XIII.

MINING LITIGATION.

It would be easy to moralize about the "general cussedness" of all mining, particularly silver mining, "which is full of dips, spurs, and angles," and, like gambling, extremely uncertain. This remark applies with peculiar force to the Comstock camps. There, as Calvin would have said, the hand of Satan was daily manifest. Never since the world began were conflicting interests, honest and dishonest, more wildly entangled than in that early Nevada.

The trouble began in the carelessness, or worse, of the prospectors of 1858 and 1859. I have alluded in a previous chapter to some of their meetings to declare laws respecting claims, and to the Gold Hill blacksmith who kept his record book in a saloon where all and sundry could and did alter the entries. If properly carried out, the district regulations might have done good service; but they were so sadly neglected that none of the early miners had what lawyers would call a title. Lord, in his history, cites the example of the original claim of O'Riley, McLaughlin, Penrod, and Comstock, now held by the Ophir and Consolidated Virginia and California companies. The four men put a stake on the line of the croppings fifty feet south of the place where the strike was made, and another one fifteen hundred feet north of the first stake. This gave one claim to each of the four, and one extra

claim for the discovery, which was the custom at the time. They posted no notice (as the rules required), they recorded no notice either then or afterward (expressly stated to be the most important evidence of ownership). Then came one James Cory, a chum of Comstock's, and asked for a share. Not receiving it, he posted a notice and claimed four hundred and fifty feet adjoining the claim of Comstock & Company. This was half as much again as he had a right to under the district laws. Big John Bishop and a miner named Camp told him that it was their ground, and the three finally divided but did not record the claims. Several other overlapping claims were made informally, and shortly afterward the miners discovered that upon one part of the lode, seven hundred and ten feet long, they had actually taken up and recorded fifteen hundred and fifty feet! Compromises and various readjustments followed, but so obscure and conflicting were the records and the "memory of witnesses" that titles in this part of the Comstock have always been unsettled.

There is a very strong reason in the nature of mines and miners for many of the delays in properly defining a claim. Every part of a ledge is not equally rich. Ore occurs in "seams," "chimneys," or "chutes," and as soon as a man "struck it rich" his first thought was usually to explore it until he could select and stake out the best three hundred feet. Nearly all of the early locators on the Comstock were trying to get the richest slice in the lode, and they kept away from the recorder's office; or if they entered a claim, they took care to leave it in such shape that it could be altered, like some of the Spanish land grants of California that were "floated" ten or fifteen miles, much to the subsequent profit of attorneys.

Even when the "metes and bounds" were well defined the guileless miners could not always be depended upon to leave them so. One of the pioneers mentions a mining suit in which the matter hinged upon the location of a stump that marked the corner. Judge and jury adjourned and went to look at the stump. It had been dug up bodily during the night and carried off, and the ground was so levelled that not the slightest clew remained. Each side accused the other, and the case was never decided.

All the American mining camps have maintained in the case of quartz ledges the right to an inclined location—that is, the right to take a claim of definite size and follow it downward at any angle or angles, taking all the ore in the vein and in its legitimate branches. A miner, according to this idea, takes up a piece of ground simply for the lode, and goes wherever it goes. Spanish mining law, on the contrary, recognises only the square location. According to the Spanish plan, as soon as a ledge passes beyond the boundary of a square piece of ground of given size it belongs to the man in whose tract it lies. One can easily see that the Spanish system must prevent much trouble and render the single-vein problem immaterial. In fact, it rules out of court nine tenths of all the cases that lead to lawsuits. Matters rapidly went from bad to worse on the Comstock until the most casual observer would have seen a wild Walpurgis-night revel of conflicting claims of every size, shape, and age tumbling over each other three and four deep. It is hardly surprising, for the Comstock was not the only vein on the side of Mount Davidson, nor even the most prominent one. The Virginia lode was nearly parallel, and other veins, too many to name and hardly worth while digging up from the dust of forgotten records,

crossed and recrossed the original Comstock until even ideally honest and painstaking miners, geologists, and courts would have found it impossible to straighten out the tangle that began when the first stake was driven at Gold Hill. When, as of course soon happened, the miners became very much excited, when courts and lawyers were subjected to enormous temptations, and when it was found that geologists and mineralogists could not settle the question beforehand, the result is easy to sum up. Everywhere in the period of litigation there were almost inconceivable expenses, ruining the lesser mines, preventing dividends even where miners were working rich bodies of ore. Titles were clouded for years, and the finest legal intellects in America wrestled on the Comstock in cases that are still famous.

Let us turn again to the genial Ross Browne for a characteristic picture of the contentious miners. He says that when he entered Virginia City by way of fitly-named Devil's Gate a fraction of the crowd "were engaged in a lawsuit relative to a question of title. The arguments used on both sides were empty whisky bottles, after the fashion of the Basiliunum or club law which, according to Addison, prevailed in the colleges of learned men of former times. Several of the disputants had been already knocked down and convinced, and various others were freely shedding their blood in the cause." The Comstock ledge, Mr. Browne thought, was very fine, but it was held at a thousand dollars a running foot "when not even the great Comstock himself could tell where it was running to." The whole region was in the midst of a free fight among the various claimants. The Comstock was "in a mess of confusion." Its shareholders had the most enlarged views, but those who had struck croppings around

the Comstock were just as liberal in their ideas, so that, in brief, "everybody's spurs were running into everybody else's angles." The Cedar Hill Company was spurring the Miller Company, the Virginia ledge was spurring the Continuation, the Don Company was spurring the Billy Chollar, the Washoe was spurring everything else, and all these, the Comstock, and a dozen others, were interlocked spurs with spurs and angles with angles, like a Chinese puzzle.

A study of the map of the United States Geological Survey, showing the locations at even a later date when many of the earlier claims had been consolidated out of existence, will convince any one that the preceding description of the Gordian knots left for the lawyers are only the merest glimpses of a state of things that should never have existed, and that cost the young mining communities of Nevada uncounted millions. Still the age of litigation, here as elsewhere, only proved the existence of a rich camp. Men do not fight "like grim death" for worthless ground.

Contests in the courts began as soon as the prominent mines had cut far enough into the ore bodies to be ready to infringe upon each other's claims. The real geology of the district then became a pressing problem. Since the miners were determined to hold fast to the "inclined-location" method, the main problem was as follows: Were the quartz bodies narrow veins separated by barren rock, or was all the vein matter deposited in one great irregular fissure, partly filled with wedges and masses of porphyry? Did the Comstock really consist of a single vein, or was it a multiple vein? Such were the questions that divided the miners into two hostile camps. What is now universally recognised as a monster lode then seemed

to consist of a number of narrow, well-defined ledges, two of which were very prominent

But to call the system a single lode was to entitle the first locators to divide among themselves nearly everything along the hill slope and over the whole Comstock basin, and the rows of later locations, east and west, were annihilated at a blow. Even the Californians who had bought out the original claimants of the Comstock did not dream of such wide-reaching ownership. Besides, the great majority were outside, and naturally held to the popular many-ledge theory. A few strongly organized and wealthy companies, holding what turned out to be the main ledge, ultimately decided to push the single-ledge theory, but at first all the evidence was dead against them.

Since the Comstock near the surface dipped toward the west, it separated more and more from the line of claims on the east, and the first conflict was therefore with the nearest line of claims on the west. The small ledges here seemed very rich and were perpendicular, or nearly so. Thus the sloping shafts of the Ophir, Mexican, and other mines soon came in contact with the vertical shafts on what was termed the "middle lead." The result was the case of Ophir *versus* McCall, which came up in Genoa, September 3, 1860, before Judge Cradlebaugh in the loft of a livery stable. Several hundred armed men sat behind the respective parties to the suit. One witness was shot at a number of times as he rode down the ravine at night. Although the famous William M. Stewart—rugged, masterful, full of vitality, already recognised as the coming king of the Comstock—was attorney for the Ophir, he could only force a disagreement of the jury.

Mining cases accumulated steadily until Judge Mott opened the First District Court in February, 1862.

By that time every valuable claim in the region was a "fighting claim"—that is, it was deeply and violently in litigation. Suits to dispossess claimants, suits to prove trespass, perjury, or fraud, single-ledge suits and multiple-ledge suits—these were as thick as blackberries. Wrote a correspondent of the San Francisco Bulletin: "We shall never outgrow this perpetual litigation until the courts rule that all indefinite or floating claims are worthless. If you find anything worth having, some one will levy blackmail."

Fights between rival claimants were frequent and bloody. Sometimes such fights took place "at the front"—that is, at the end of a drift. If there was reason to believe that a rival company was working on disputed ground, the superintendent of the first company took steps to drive them away either by smoking them out with sulphur or other substances, or by running a drift into the place and sending a body of miners with picks and shovels to overpower the enemy. "Fighting men" were hired at ten dollars a day in some cases, armed with knives and pistols, and sent to disputed territory. In fact, while cases were being argued in the courts, miners were sometimes fighting underground. The men of the Keystone Company drove away the miners of the Peerless, took possession of their shaft, and filled it with waste rock. The Grass Valley miners were assaulted through a drift by men of the Bajazette and Golden Era and driven to the surface. The Uncle Sam boys drove out the Centreville men in a similar manner. Yellow Jacket sappers cut into the Gentry shaft and smoked out their rivals. The Gentrys countermined and blew "all sorts of stinking smudges" into Yellow Jacket until the people of Virginia protested against the unendurable odours that filled every house in the city.

One of the most famous suits of the period was brought by the heirs and old-time backers of the Grosh brothers, who, it will be remembered, had been prospecting for silver and had organized several companies before the Gold Hill discovery. The shareholders in these forgotten enterprises now formed the "Grosh Gold and Silver Mining Company" and claimed 3,750 feet in the best part of the Comstock. Capitalized at \$5,000,000, and afterward at \$10,000,000, they soon sold enough stock to make a long and brilliant fight. The Nevada newspapers, like Silas Wegg, "dropped into rhyme" such as the following:

The Ophir on the Comstock
Was rich as bread and honey;
The Gould and Curry, farther south,
Was raking out the money;
The Savage and the others
Had machinery all complete,
When in came the Groshes
And nipped all our feet.

After long and costly litigation the heirs of the Grosh brothers failed to secure any foothold, and so dropped into oblivion.

Another most difficult, protracted, and expensive mining suit was between the famous Billy Chollar and the Potosi (pronounced by old Comstock *Potosée*). The Chollar Company, after a long series of minor difficulties with the adjoining claim (Potosi), claimed that theirs was the original ledge, and brought suit to "recover possession of a surface claim four hundred feet wide and fourteen hundred feet long," including, of course, a large part of the Comstock lode with the inevitable "dips, spurs, and angles." The companies fairly locked horns over this difficulty in 1861, and

spent about a million and a half before they concluded to unite their shattered fortunes in the great Chollar-Potosi.

When this suit was brought, Judge Mott, who was on the bench of the First Territorial District, favoured the Chollar side in their geological theory that the Comstock was only an offshoot from their vein. Mott, to quote from Bancroft, "was therefore bribed or worried into resigning." The new incumbent, Judge North, finally decided in favour of the Potosi crowd. North was soon afterward forced to resign "to avoid the scandal of which he was the subject." Chief-Justice Turner was persuaded to follow his example, and finally the members of the bar asked the one remaining judge to resign, which he did. Both sides had received conflicting decisions in the course of this pitiable affair, but neither side, as it turned out, felt willing to have their methods of conducting litigation made public, and so, as I have said, the companies consolidated.

The great fight, however, unique in many respects among mining suits, was that instituted at a very early date by Burning Moscow against Ophir. The new company, under the title of "Burning Mosca Ledge Lucky Co.," claimed, in April, 1860, 2,400 feet "west of Virginia City, between the Central and Virginia ledges." Their ledge was said to be distinct from that of the Ophir, and to be "twenty-three feet wide in good ore." The stock was "boomed" in San Francisco, and soon the company had the sinews of war and came to the front in support of the favourite many-ledge theory as against the belief that ledges a mile away sprang from the roots of the Comstock and would eventually fall into the hands of the "only original Jacobs," the first line of locators.

Burning Moscow made an assault with terrible effect. All the wheels of the courts were set in motion. Ophir began buying out interests in other claims on the rival lode. The Garrison Company also brought suit against Ophir; the Whitbeck Company did the same, and the McCall Company followed, until Ophir purchased all their claims, which were on three so-called ledges lying within fifteen hundred feet of each other. Old Virginia made his last public appearance in connection with these Ophir purchases. Some of the claims they secured depended upon the original notice of location. Finney would not or could not find it until the superintendent of Ophir persuaded him into a tunnel and locked an iron gate upon him. In the morning he was sober and willing to produce the notice. He went to the disputed ledge, pried off a weather-beaten slab, and found a yellow paper, the original location notice that he had put there in 1858.

Burning Moscow, whose location was disputed in a similar manner by claims on sub-ledges, consolidated about this time with its several tormentors, increased its capital stock from half a million to three million dollars, and returned with multiplied energy to the assault upon Ophir. California and Nevada courts were shaken by the tumult of the struggle. The first onslaught of the Moscow supporters had lasted for two years, and the second lasted quite as long. The pioneer Comstockers were again and again questioned and cross-questioned, until the little that they knew was inextricably confused with the host of mining romances of the period. Some of them fairly lived on witness fees. The district record book was made to uphold each theory by turn. Meanwhile the real question in dispute could not be determined except by actual exploration.

Gradually this view of the case began to prevail. The community felt that the development of the district was fatally handicapped by such gigantic litigation. Suddenly Burning Moscow discovered that whatever might be at the bottom of their ledge, the top was chiefly lead and base metal. It was no Comstock, but contained only a very low-grade ore that could not be milled at a profit after a few surface stringers were mined out. Burning-Moscow stock fell from four hundred dollars to five dollars a foot, and Ophir bought the disputed property. First and last, the direct expenses of the fight had been more than a million dollars.

The mining suits which have been briefly described were only a few out of a great multitude. In 1863 some thirty cases, involving property valued at fifty million dollars, were in the district courts. "We had to fight fire with fire in those days," said an old Californian. Men who saw their whole fortunes at stake were not always scrupulous about ways and means, and their active agents were less often so. The atmosphere in which these interminable litigations were carried on became heavier and blacker every year. Public confidence in witnesses, juries, attorneys, and judges was sorely shaken. The Attorney-General of Nevada in one of his State reports, referring to the period under consideration, said: "Chicanery won more suits than eloquence and learning, and corruption more than solid merit." Nine tenths of the voting population of Storey County once signed a petition asking all the judges to resign.

Nevada's peculiar pre-eminence in the matter of litigation from 1860 to the end of 1865 is clearly exhibited by the Court records for that period. Ophir was in thirty-seven suits, in twenty-eight of which she was plaintiff. Yellow Jacket came next, with

thirty-two suits, being plaintiff in twenty-four. Savage was nearly as litigious, having had twenty-nine suits and acting as plaintiff in twenty-two. Gould and Curry comes next, with twenty-seven suits, twenty of which were "actions brought." Overman had twenty-three suits. Eight more of the leading Comstock mines of the period under consideration (not including Consolidated Virginia, California, or the later combinations) had from nine to seventeen suits apiece. The total for twelve mines is two hundred and forty-five lawsuits, in seventy-seven of which the companies named were defendants and in one hundred and sixty-eight of which they were plaintiffs. In other words, more than two thirds of the suits were to dispossess the claimants of ground the plaintiffs considered as belonging to the Comstock lode under the single-ledge theory. The direct cost of all this litigation was ten million dollars—one fifth of the entire product of the Comstock during that period. What an illustration of the wasteful yet magnificent energy of the early Comstockers is the fact that this heart-breaking litigation began almost as soon as the discovery of silver was made, and rose to its greatest developments at the same time with the gigantic mechanical achievements and the vast underground works of the epoch! Five of those Nevada years were the equivalent of half a century of every-day life and of ordinary enterprises.

Great were the legal intellects that were at the disposal of the mining hosts fighting so steadily for control of what began to be called on the Pacific coast the "Treasure-house of the World." Some of the famous cases were tried in San Francisco, where the leading companies soon had their places of business; but Virginia City and (after the admission of Nevada in 1864) Carson, the State capital, were the principal battle

grounds. The leading Comstock lawyers became famous throughout the United States. Young attorneys trained on the Comstock followed the prospector, the miner, the mill owner, and the freighter to camp after camp in the desert and the high Rockies till the principles of American mining law were expounded in Dead-Sea hollows below the ocean level, and in clusters of pioneer cabins above the clouds, ten thousand feet higher than the ocean floor, in the Alps of Colorado. William M. Stewart, the "old invincible," tireless in devotion, incapable of fatigue, master of mining-camp juries, received from Belcher \$165,000 and from Yellow Jacket \$30,000 as single fees. His professional income during the years of litigation was \$200,000 a year. General Thomas H. Williams made four million dollars from mining property deeded to him as fees for his legal services.

CHAPTER XIV.

STOCK AND THE STOCK SPECULATORS.

IN these days nine men out of ten know something about mining stocks and methods of dealing in them. At the time of the discovery of the Comstock there was no such thing on the Pacific coast as a stock and exchange board where shares in mines or companies could be listed and transferred. But the people of the entire Pacific coast were highly prosperous and ready for speculative investment. There were few manufactures, so that real estate and mines offered almost the only opportunities. The invention of methods by which the dollars of the servant girl and the farm labourer could be used to speculate with suited all classes alike. Assessments furnished the impetus that carried the Comstock mines safely over periods of depression.

Men were trading and selling not shares, but feet and inches, on the various ledges of the Comstock group all through the eventful summer of 1859. The first trouble was that no one had any cash, excepting a few newly arrived Californians. The second trouble was that nothing was developed sufficiently to show other than a speculative value, even on the main Comstock lode. Buying such property seemed to cautious men the wildest of gambles, even at absurdly low prices. Prospectors and speculators were staking out the country for miles around. There were times when, if quartz

ledges could be supposed to take a personal interest in their fortunes, the Comstock would have been seen to stand abashed, flushing with indignation at the way in which its sworn lovers were flirting with base-metal outcroppings in the sage brush and deserts.

One will fail to appreciate the completeness with which the Pacific coast became in a day captive to silver unless he accepts the great rush to Washoe as merely the outward and visible symbol of things spiritual and intellectual. Men, women, and children yielded gladly to the spell—the story of another Peru, and the eager silver hunters were met on the summits of the Sierras by ragged, hungry, but desperately happy prospectors who told them that Washoe was richer than their dreams had pictured it, and who offered them mining feet in claims here, there, and everywhere for a few dollars.

“The truth is,” they whispered to the incoming Californians—“the truth is that I am dead broke, but I have a fortune sufficient for any man in even the poorest of these claims which I have taken up or traded for. Five feet is enough to make a man rich, and if you can not take more, take five feet, it makes no difference where, at ten dollars a foot.” Then they showed specimens so rich, black, and heavy that the Californians held their breath with envy, and, whether they bought or not, hastened on with redoubled energies. There was something wonderfully childlike and confiding about the bargains and transfers often made after precisely this manner in the Sierra passes between entire strangers.

In a few months the professional speculator, “the man who worked claims with his jaw instead of his pick” (to quote a common Washoe sentiment), was to be seen everywhere. Such men “huddled about

corners of Virginia City consulting in low tones about various claims"; they straggled in from the Flowery diggings or other supposedly rich places with specimens in their hands, "offering bargains," as Ross Browne writes, "in the Rogers, the Lady Bryant, the Mammoth, the Woolly Horse, and Heaven knows how many other valuable leads, at prices varying from ten to seventy-five dollars a foot." The old, old games, as ancient as human capacity for swindling and being swindled, were everywhere in full operation, though no one as yet called the process "dealing in stocks." They were "bucking and bearing" (the term "bull" was not then known on the Comstock). They were "trading claims." They were "stuffing each other" after every conceivable manner and diligently blowing "Washoe bubbles." Mad speculation was everywhere, but no money was to be seen except in gambling rooms and saloons. Silver was everywhere underground, if reports could be credited; lawsuits, deeds, mortgages, and agreements to transfer everything on top of the earth or within it were as thick as autumn leaves and hardly as durable. Everybody was a billionaire in silver-claim inches, feet, yards, and rods, "including dips, spurs, and angles," from the top of Mount Davidson to the bottom of—Devil's Gate.

Ross Browne, whose genius caught many a glimpse in the rapidly turning kaleidoscope of the Comstock, remains our best guide through the "horrible confusion of tongues," the crowds of roaring, raving drunkards, "swilling fiery liquids from morning to night"; the "flaring and flaunting gambling saloons"; the "torrents of imprecations"; the feverish, unhallowed thirst for gain; the crowds of crazy-looking wretches running hither and thither, hurrying to assay offices, pulling out papers, exchanging mysterious signals—

these Washoe millionaires with their outcroppings and indications from the "Wake-Up Jake," "Root Hog or Die," "Wild Cat," "Dry-Up," "Grizzly-Hill," "Same-Horse," "Let-Her-Rip," "You-Bet," "Gouge-Eye," and other famous ledges and companies. All night long, as Browne elsewhere reports, these fiendish noises contended, and his ears were overwhelmed with unintelligible jargonings and the difficult slang of the new mining camp. He tried one night to sleep at "Zip's," where twenty bunks were in the room, and found that every inmate except himself was bent on passing the entire night trading and transferring claims in the midst of shouting and universal pandemonium. He and the late Henry De Groot fled for refuge to a hole in the hillside and wrote letters to the New York Times and the San Francisco Bulletin describing in most realistic language the strange scenes about them.

What most surprised and often shocked the visitor was the fact that all this turmoil, this restless concourse of amateur stockbrokers and new-fledged speculators whose ranks increased daily, this howling and perennial insanity, occurred in a frontier camp in the midst of noble mountains where only a short time before the profound peace of an untroubled wilderness had reigned supreme. One writer suggested that if the New York Stock Exchange should hold its meetings on the top of Mount Rigi the scene would be paralleled, but in many respects it was a situation that was entirely new to the history of speculation in America, and the strangely mingled Comstock crowd of 1860 was certainly more wildly picturesque on the windy flank of Mount Davidson than even the most turbulent of well-dressed New York brokers and speculators. As they swayed through alleys between flapping canvas tents they seemed the chattering, half-dazed, wild-

eyed survivors of all nations and races thrown shattered and homeless into the desert after some vast world catastrophe that had erased from existence everything except the wealth passion and the ledges of Washoe.

But prices of mining claims could not rise forever. With drastic sarcasm an "old resident of Washoe," who is supposed to have been the late J. W. Simon-ton, one of the owners of the San Francisco Bulletin, described the situation in May, 1860: "We are informed that there is a panic in San Francisco in relation to our mining stocks; that nothing will sell; that even Ophir, Washoe, Chollar, and Corsair are drugs in the market; that banks won't discount Washoe speculators' paper; that Lady Bryan sells for fifteen dollars and Rogers for forty dollars; that the bottom has fallen out. Two months ago," he continues, "these wise men of 'Gotham went to sea in a bowl and got badly wet. Two months ago everything would sell. People bought blindly in the Bob Ridley, Last Chance, and Bob-Tail Nag. Where they were located, what was the character of the rock, who were the locators, and what the title, were not matters of inquiry. Fools at your end of the telegraph were deceived by knaves at our end; we sent to you mysterious hints of new discoveries that never existed, strikes in mines never located, accounts of sales that never took place. Your prudent men who would not buy a foot of land in San Francisco or make a loan without careful search of title have risked thousands without a thought. Your greedy folly was taken advantage of by our avarice; you became the victims of your own sublime stupidity and dishonesty."

A conservative estimate made in 1860 placed the number of claims located, interests in which were in most cases on the market, as five thousand within a

radius of thirty miles from Virginia City! Only three hundred of these claims were ever opened at all, and only twenty were considered by careful outsiders as "thoroughly well established mines." Time was to show that only eight or nine of the twenty which were considered absolutely certain investments were to pay dividends. The majority of these five thousand claims lay forever idle. One would not have known that they were called mines except for an occasional claim stake or a fluttering, badly spelled notice on "indications" which were seldom attractive to competent mineralogists. Iron pyrites and all sorts of worthless metals were as good as gold and silver to the enterprising adventurers. Gopher, squirrel, and coyote holes furnished indications on the strength of which claims were laid out. Ignorant and plausible speculators with a smattering of geology added to the confusion. Before long men were claiming to have ledges of iridium, platinum, plumbago, and various other valuable substances. One Washoe prospector being informed by a San Francisco man that he wanted an ambergris mine, replied that he had one already staked out and for sale. A group of men under direction of the "spirits" tunnelled for weeks into the granite of Mount Davidson in order to tap an alleged lake of coal oil.

Besides the five thousand actual claims there were many more prospect holes a few feet across—mere ragged pits or cuts in the yellow sand, clay, or rocks of the barren hillsides. Prospect holes, too, were about all that one could see on the vast majority of claims already held. They dotted the whole region in wind-blown heaps and hollows between dismal clumps of sage brush and the dull yellow of coarse sunflowers that occasionally bloomed in the freshly broken slopes.

This was the sort of thing, for the most part, that the staid old merchants of San Francisco and Sacramento had been fighting over in the spring of 1860! Virginia City and Gold Hill record books show that nearly sixteen thousand claims were recorded in those districts in the twenty years after 1859.

Donald Davidson, the first ore buyer on the Comstock, was soon introduced to one of the favourite jokes of the fun-loving miners who were quite well aware of the innate absurdity of claim-staking the whole of Nevada. After he had agreed to buy two hundred tons of selected Ophir ore at two hundred dollars a ton and to ship it at his own expense per Carson mule fast-freight train, the miners celebrated the important event by a trip to the top of "Sun Peak," which then and there was rebaptized Mount Davidson. They showed the honest old Scotchman dozens of quartz veins on the way up, and told him they were fairly running over with richness. After their return in the evening they proposed to locate claims on these new ledges for the banker and all his personal friends. The recorder was called in, and Davidson gladly put up fifty cents apiece for some twenty-five claims in the granite masses of the grand old mountain. Then the jovial recorder suddenly invited the crowd to aid him in the liquid transmutation of some of the Davidsonian gold.

Throughout the entire period of stock speculation, in all its ebbs and flows here and elsewhere as well, every student is surprised at the fewness of the paying mines and at the number that hang helplessly upon reputations made for the various districts by one or two magnificent properties in each. The bullion reports from these stir the pulses of investors and speculators alike, and they often pour successive assessments into

worthless and barren places for years. The sum total of the dead-work of the Comstock period is almost incalculable. Men of large capital and the millions with their small savings united to explore the ledges of Nevada at an enormous expense, and often upon entirely unprofitable mines, or rather not—mines. To individualize these cases of profligate outlay, writes one of the old Virginia City editors, “would be simply to catalogue the leading enterprises carried on during this epoch of prodigality and mistake.” Ten million dollars was spent in sinking shafts and running drifts about Virginia City without finding a single large and lucrative mine.

There are the forgotten Palmyra and Indian Spring districts in Pine Nut Range where two pretty little towns once stood, but now only the graveyards remain. There is that Nevadan Golgotha of speculators, Esmeralda, where millions of dollars were wasted. Beyond, toward the Humboldt, in range after range of bleak, desolate mountains, or in the tawny desert, are the ruins of abortive mining enterprises. In every direction—east, west, north, south—credulous stockholders staked and lost vast sums of money before the close of the '60's. Over in the lava of Pine Woods district in 1863 some Virginia City men sold a group of mythical mines and received a very large payment down. The New York buyers spent another fortune and departed, leaving the holes in the desert. Everywhere, for hundred of miles, on steep ranges, in sandy wastes, money was spent without stint upon misguided and foolish mining enterprises, supported almost always by associations and companies. Said Dr. De Groot, who had visited nearly every camp on the Pacific coast, “That's the dilapidated mill of the Let-Her-Rip”—and, true to its name, it burst the financial integu-

ments of every stockholder. "I haven't time," he continues, "to relate the story of the 'Wild Emigrant,' the 'Shamrock,' the 'Silver Lyre,' the 'Pungle-Down,'" and he makes passing mention of many other wildcats and abandoned districts of the '60's, such as the "Lunar Rainbow," the "Bloody Thunder," and the countless host of unproductive mines in Cortez, Silver Bend, Reveille, Pahrnagat, and classic White Pine.

Later came others, dragging luckless speculators down the paths of ruin—barren Panamint, on the edge of the terrible Death Valley; Marietta, in the Excelsior Mountains, where the whole deserted town still lies bleaching in the sun; emptied, ghostly camps by the score, dead, unburied, weighted down by human curses. Each one of them was hailed in its day as a new and greater Comstock; each one in its fall destroyed homes and made suicides. The smallest and most ephemeral of them all has had a history which, had it occurred in some staid farming community, would have made the place memorable as the scene of an awful disaster. But, spread widely over time and space, the ruin that follows the failure of a promising camp is difficult to trace or measure, especially in these lesser instances. The Amazonian current of Comstock speculation sweeps far out into the ocean of human life, strewn with its multitudinous social wrecks, and it still remains the pre-eminent type of its class.

As time passed, mining stocks became more and more the typical and most popular form of speculation in California and Nevada; often the whole community seemed to be dealing in them. There have been periods when leading brands of goods have been named after favourite mines, when streets, squares, parks, and children were christened in the same way, and when the slang of the mining market was used by every class of

society and in every learned profession. The bar-keeper mixed "bonanza" drinks and talked of his stocks. Boys and girls, servants, labourers, mechanics, and clerks were calculating upon gaining fortunes with their little savings. All classes alike helped to sustain the stupendous game of silver mining in Nevada. "The market," said the Mining Review in 1870, "extends everywhere; the buyers and sellers of stock include the millionaire and the mendicant, the modest matron and the brazen courtesan, the prudent man of business and the gambler, the maidservant and her mistress, the banker and his customer."

The whole history of the Comstock lode is revealed in the assessments, dividends, and fluctuations of the stocks of the separate mines. There every consolidation of interests, every lawsuit, every period of extravagance and of economy is written so that he who runs may read. Before the end of 1861 eighty-six companies were organized and working the Comstock and adjacent mines; their aggregate capital was \$61,500,000. Only a few were paying at the time, but every one fondly believed that they would all wheel into line before long. The prodigality that followed in the days of the earlier bonanzas was partly the free-handed liberality of Californians trained in the schools of the placer camps, and partly the unchecked extravagance of gambling stockholders. Gould and Curry, a marvellously rich mine, took out nearly nine million dollars and declared \$2,908,800 in dividends during 1863 and 1864. The actual investments made by its owners, who bought it for a few thousand dollars, had been less than \$200,000; but the expenses of the company during that two years was close upon six million dollars, or more than twice the dividends. It has been reckoned that the dividends from the nearly 110,000

tons of ore milled during those two years might just as well have been four and a half millions, as less than three millions, if the company had worked all its ores in its own mills and with less haste. But, as the president of Gould and Curry said, "every stockholder wanted it snaked out at once, at any cost, and so we wasted a third of our profits."

The first great depression in mining stocks (after they had any commercial value at all) began as soon as the rich ore chutes near the surface had been worked out and the search for new deposits had begun, with consequent assessments. Shares rained on the market from all directions, and hundreds of prominent men were ruined. Gould and Curry, which in 1863 sold at \$6,300 a square foot, fell to \$900 in 1864. Ophir dropped from \$1,580 to \$300. Savage went down from \$2,600 to \$750. Every mine on the Comstock suffered in a similar proportion, and the "wilcats" of the outside districts were "out of sight, underground."

While the leading mines were drifting for more silver along the east wall, some directors, who desired to keep the news of any "find" from reaching the ears of the public, conceived the idea of confining miners to the mine for days at a time. They received the best of care and often had increased wages. In 1868 Hale & Norcross tried the experiment. When the men were released the superintendent reported a strike, and the stock rose from \$1,300 to \$2,200, though the mine did not justify the increase. Speculators soon became so suspicious of the plan that the stocks of a mine were quite as apt to fall as to rise when the miners were imprisoned.

According to the present plan, when a mine reaches rich pay-ore the superintendent, who has long watched

the process of the work, generally knows it first. The doors of the building over the mine are closed and admittance is refused to all outsiders, even to reporters. Only a few of the men in the mine have had a chance to find out anything, because, if the superintendent knows his business, a "secret shift" has done all the work for weeks at the advanced point in the drifts where ore is expected. The oldest and most reliable miners are chosen for the shift. They are seldom ordered in set terms to hold their tongues, but if anything regarding the mine gets abroad every man on the shift is discharged. The truth about the inside of a mine can seldom be obtained from a miner that works there. Loyalty is ingrained in the very nature of the man. Though nearly every miner buys stock, and it would be strange if he did not, he is up to all the points of the game, and if he is on a "secret shift" can manage to conceal his information from the shrewdest of "curbstones brokers" or mining spies.

Virginia City in times of stock excitement was honeycombed with newspaper reporters, agents of dealers, and outsiders whose business it was to obtain by fair means or foul an exact knowledge of the condition, present and prospective, of the Comstock mines. Every one who was connected with the suspected mine or mines was shadowed as closely as if he was a counterfeiter. A Comstock tradition is to the effect that on one occasion when the air was full of hints of a strike, but nothing could be gleaned in any direction, a shrewd mining detective hid in the works, saw the superintendent come out and take off his dirty mining clothes. He slipped in, and finally managed to scrape a few ounces of dust and clay from boots and overalls. This waste, when assayed, showed that some drift the superintendent had been examining was in a new and very

rich formation. He wired his backers to "buy hard," and they made vast profits.

During every great stock excitement the mining towns themselves are loud-buzzing beehives, sending out the latest news, buying and selling stocks with feverish haste. In Virginia City as well as in San Francisco at such seasons fortunes have been made and lost in an hour. It is curious to see how people behave when stocks start upward again. Those who lost in the previous spurts remark calmly to their friends: "Now this time I shall sell at a fair profit; let the other fellow make something too." Pretty soon stocks jump a little higher. "Now when I can double my money, off I go for a vacation." Then stocks fall off a few points, "get soft," then harden, then "run again softer." "Some one has been telegraphing lies about the mine to San Francisco," says our friend. But matters grow worse, the holders are called upon to make good their bargains, and the boom ends in a crash, with our luckless friend still holding his shares.

In Dan De Quille's Big Bonanza is a letter said to have been received in Virginia City from a Frenchman who had become acquainted with the meaning of the term "mud," and I quote a portion: "By zee advice of our goot friend," as the inquirer stated, "I have procured some time past on what you call 'on zee time' many shares of zee Bobtaile. He, mine friend who repose on zee inside, express himself of zee mine wis moche enthusiasme. Zee mine be one merveille de la nature; zee works un chef-d'œuvre de l'art. But now, pretty soon—le diable! Zee brokaire man use zee expression to me as follows: 'more mud.' So many, five, seex time have he, zee brokaire, desire of me some leetle more mud that now I mus make one gran sacrifice pecuniare. It be now become scandaleuse. Pretty

soon you have one crash financial—I gone bust—me. I be ver moche perplex wis zee stroke of prices. He viggles up, he viggles down, all zee time. Will you have ze complaisance to inform me how soon he will viggles high up, an remain to pass some time up dare? ”

In order to illustrate more forcibly the fluctuations of the stock market during the ten years following 1867, I have gathered the following notes upon two typical mines from the commercial columns of the San Francisco newspapers:

Alpha, an assessment mine, sold for \$1,570 in February, 1868, fell to \$33 in September, rose to \$62 in February, 1869, sank to \$11 in October, rose to \$21 in March, 1870, sank to \$3 in September, rose to \$20 in September, 1871, and to \$240 in April, 1872, then sank to \$15 in July, 1873, and rose again to \$100 in September; in February, 1874, sank to \$9, rose to \$45 in June, 1875, and sank to \$3 the same month; in May, 1876, it rose to \$67, and sank in December to \$18; in 1877 it fluctuated between \$5 and \$23. Alpha, with 30,000 shares, levied \$330,000 in assessments up to 1880, and has never declared a dividend.

Belcher, unlike Alpha, was a great dividend producer, one of the three leading mines of the period, having paid in thirty-eight dividends up to 1880 nearly sixteen million dollars, with assessments of less than two millions. It had 104,000 shares after 1869 (1,100 to the foot). The price of the stock sank from \$430 in April, 1868, to \$110 in July. Then, the capital stock being largely increased, the price per share became proportionately less. In 1869 prices ranged from \$12 to \$35; in 1870 sank from \$35 to \$1; rose to \$6 in January, 1871, and to \$450 in December; sank to \$6 in January, 1872, rose again to \$1,525 in April, fluctuating all that summer, down to \$1.50, up to \$95,

down to \$9, and so on. In 1873 there were again great variations; the stock sold down to 25 cents a share and up to \$113 with many surprising eddies, going down to \$1.50 in August, and then rallying until in January, 1874, it was at \$120, breaking by November to \$42.

It would be easy to go on with these comparisons from which an instructive chart might be constructed to exhibit the rise and fall of stock values. For the purposes of speculation, the mines that did not pay any dividends were often exactly as good as those that did pay. This was fortunate for the stock owners and for the miners, mill men, superintendents, and all who made a living from the business, either directly or indirectly. Out of one hundred and three Washoe mining companies reported and regularly listed, only fourteen paid any dividends at all, and only six of these paid more dividends than assessments. The six were Consolidated Virginia, California, Belcher, Crown Point, Gould and Curry, and Kentuck.

Some of the assessments paid upon mines that never yielded a profit and paid unflinchingly for years by successive legions of stockholders were unparalleled in mining history. Alta put in \$1,317,600; Baltimore Consolidated, \$1,015,000; Bullion, \$3,352,000; Caledonia, \$1,935,000; Consolidated Imperial, \$1,125,000; Justice, \$3,230,000; Mexican, \$1,243,000; New York, \$900,000; Overman, \$3,162,800; Silver Hill, \$1,620,000; Utah, \$1,030,000. Here were ten mines that sank in assessment work nearly seventeen million dollars, while many other mines that paid some dividends lost very large sums: in the case of Yellow Jacket, \$2,454,000; and of Sierra Nevada, \$3,747,500. Hundreds of thousands of investors in every part of the civilized world have reason to remember one or another of this list of non-producers.

It has been estimated by many writers that if the highest price be taken which each mine at one time or another has brought (as figured out from the number of shares and the stock-board maximum) the Comstock has cost \$700,000,000, but there never was a single time when the entire lode, even in the stock market, was being sold at this valuation. The only possible way of estimating the profits of a mining enterprise is to take the difference between the total yield and the total expense. The currents, undertows, eddies, whirlpools, and enormous maelstroms of the mining-stock markets are of oceanic vastness, crowded with unforeseen perils, and throbbing with immeasurable energies, expressed all too feebly in billion-dollar estimates, but the actual available capital of the stock market is many times less than its fictitious valuation. If it were not so there could never be any stock market at all.

In the year 1877 the total sales of mining shares on the three San Francisco stock boards amounted to very nearly \$120,000,000. This was two years later than the height of the greatest speculative period in the history of the lode, and may serve to illustrate what used to be called a prosperous year. Without some such method of speculation no mine that did not pay its expenses from the start could ever have been developed except by wealthy owners; no ten or a hundred men would have taken the risks and invested the capital required to push work on Comstock mines as rapidly as it was pushed for fifteen or eighteen years after their location. The division of the various mining interests into hundreds of thousands of small shares gave every one an opportunity to invest in the game of chance. As long as many thousands chose to invest, the high-pressure system continued.

Reports from the San Francisco boards were bulletined in Virginia City as soon as received in times when stocks were rushing upward like auroras or falling like rocket sticks. Everybody ran to see them—flour-dusted bakers, blacksmiths with sledge hammers, white-aproned butchers, bare-headed clerks, miners on the way to the shafts, a teamster “thrusting his black-snake under the housing of his saddle mule”—all hurrying to the bulletin boards to see their fates. The streets became blocked so that the police had to clear a passage, and the town quivered with joy or sorrow with each change in the figures. Sometimes a long-drawn sigh, mysterious, universal, sought expression as values slipped away down to the depths.

As for the successful mining operator, time was when he was the most aggressive and scintillant figure in the social and business worlds of the Pacific coast. Such men as “Jim” Keene, “Bill” Lent, “Johnny” Skae, General Gashwiler, and others still remembered on Pine Street, were men who in their time knew every curve and twist of the Comstock market. Hundreds of others linked their names with famous mines and with thrilling chapters of speculation. Group after group rose to power, ruled after their kind, and fell from authority. Some few there are who have survived many a successive dynasty and are still Rajahs of the White Elephant. In flush times the leaders of stock operations were known by their purple and fine linen, their splendid equipages and their lavish expenditures, generally in San Francisco, but sometimes in a trail of corruscating glory across the continent. But every now and then a man was caught on the wrong side of the market, which fluctuated at times much more violently than anything on Wall Street. Down he went, down and under, and new men took his place. Per-

haps in the course of time, soured and blunted by misfortune, the unfortunate operator joined the ranks of the please-lend-me-a-dollar denizens of Pauper Alley, a narrow street in San Francisco between Pine and California, where the hopeless wrecks of forgotten storms of speculation are drifting to and fro.

There, in Pauper Alley, one can walk, any time in business hours, and see creatures that once were millionaires and leading operators. Now they live by free lunches in the beer cellars and on stray dimes tossed to them "for luck." Women, too, form a part of the wretched crowd that haunt the ends of the Alley where it joins its more prosperous neighbour streets and beg every speculator to give them a "pointer" or to carry a share of stock for them. These are the "dead mud-hens," as the men are the "dead ducks," of the Com-stock share gamblers. Horrible things one sees and hears of here. Old friends you thought were prosperous but had not heard of for years shove themselves out of the huddle and beg for the price of a glass of whisky. There stands a once-prosperous printer, in rags—he took flyers on the street too many times. Yonder beggar lost \$400,000 in a single summer, all good gold. The ghost of many a murdered happiness walks unseen among these half-insane paupers as they chatter like apes of lost fortunes and of the prospects of their favourite stocks. Really it is a frightful thing to walk there and look at the seamy side of the silken garment of fortune.

CHAPTER XV.

BORRASCA AND BONANZA.

A STUDENT of mining interests must rise to a broader view than that suggested by the artificial stimulus of the stock market. It is something, of course, to know what has been wasted in assessments, how stocks have fluctuated, and what fortunes have been gained or lost therein. But it is in every respect more important to observe the development of the mines from the standpoint of legitimate business enterprises, entirely independent, in the last analysis, of outside gambling elements. Individuals have been impoverished, but has the Pacific coast and the world at large gained or lost in a financial sense by the millions spent upon the Comstock?

The answer is given in official records. If we take the summer of 1859 as the starting point and sum up the assessments made by the several Comstock companies for twenty-one years, we shall arrive at the grand total of \$62,000,000, according to Government reports. Dividends paid during the same period aggregated \$116,000,000, and to this the statisticians add \$2,000,000 for unreported individual profits on mines before they were incorporated. Striking a cash balance, the Comstock ledger thus exhibits an actual profit of \$56,000,000. In round numbers, the bullion yield of the group of mines for the same period was valued at \$306,000,000. Subtracting the profits, we have as

the cost of the purchasing, maintaining, defending, and developing the great lode for twenty-one years, \$250,000,000. Three fourths of this sum, it must not be forgotten, came from the mines themselves; the other fourth was the result of direct assessments upon the stockholders.

Turning to consider the other elements of cost, we find that the prospectors and original locators upon the lode received less than one hundred thousand dollars for their claims; also that subsequent owners paid less than a million dollars out of their own pockets as "working capital" before the levying of assessments began. Practically, therefore, and viewed as a whole, the Comstock lode in twenty-one years created from its yield, and at the cost of only about sixty-three million dollars (adding the assessments as previously noted), all the values of towns, mills, mines, machinery, and other co-ordinate actualities too numerous to catalogue.

The one distinguishing feature of all mining is the fact that the finest engineering skill, the special training of geologists and mineralogists, the hereditary instincts of the descendants of generations of miners, are, and always will be, incapable of mapping out mining territory except by tedious and expensive explorations. There are in all mines periods of high production separated by periods of low production. There must be "*bonanza*" and "*borrasca*."

Both these words are borrowed from the Mexican miners. They have musical and expressive phrases for cuts, adits, hanging wall, foot wall, tunnels, shafts, and every part of a mine, as well as for every operation connected with mining. Two Mexican mining terms are now generally known to Americans. When a mine is not in pay ore, or the vein has "pinched out" or

disappeared, it is "*en borra*," or "*emborrescada*," or "*borrasca*." As one hears it on the Pacific coast, it implies ill luck or hard times, coupled with stern resolution to keep pegging away.

I once heard a rancher greet a friend with, "How are things with you, Jim?"

"Still in *borrasca*, but it can't last forever," was the reply.

"How did it happen, Jim?"

"Well, I struck pay rock buying cattle in Modoc an' tradin' that-a-way. Then things sorter dribbled out till I dropped down to sheep herding up on the Chowchilla, an' you know that's *borrasca*."

"So it is, sure! Well, here's wishin', as the Greasers say, that you may hev as many days in bonanza as you hed in *borrasca*."

The antithesis is plain. Bonanza—a large body of pay ore—has come to mean especial prosperity. The allusion is to a cheerful proverb of the Mexican silver miners, which runs: "As many days as you spend in *borrasca* you will surely spend in bonanza." Mexicans have often been willing to take leases of non-paying mines based upon the condition that if they find a bonanza they shall be allowed to work it for as many days as they had laboured to find it. Such a lease was once given on the Comstock, and the Mexicans spent six months tunnelling through barren rock before they gave up in despair, much to the joy of the superintendent, who had begun to think they had really found a bonanza and were only trying to lengthen their time sufficiently to be able to "clean up everything in sight."

It is one of the striking features of the story of the Comstock that some companies have usually been in bonanza while others were in *borrasca*. Something on the great lode has been paying dividends even at

times of greatest depression. The working theory of mines is to be exploring for new ore bodies while working out the ore in sight, so as to occupy both workmen and mill. But in practice this is often impossible, so much "dead work" has to be done to find and work the ore bodies and so much barren space is passed over. As long as active exploration is being kept up in a mine there is always a chance of a strike. Many stock speculators depend upon the simple rule of buying whatever has been a long time out of luck. This rule has made and lost fortunes on the Comstock.

There is something sudden, unexpected, and temporary involved in the term "bonanza." No one expects or plans for a bonanza of any sort; it means much more than merely pay rock. So it usually happens that when a company strikes a bonanza the stock has been "kicking about the street," to use the broker's phrase, which means that it was like so much waste paper. The chief owners of the mine and their friends try to gather in all the stock they can; pretty soon there is a whisper of a new bonanza on the Comstock, and up the prices go, far above their true value, then they tumble back again. The hope of a bonanza, or the rumour of its actual presence, has been at the bottom of every stock excitement. Safe, steady pay ore produces no such flurry on the street.

What is known on the Comstock as the "old succession of bonanzas" began comparatively near the surface. Ophir, Mexican, Savage, Gould and Curry, and Hale and Norcross, all found much ore along the first line of work. After the vein was discovered to dip toward the east the second line of shafts was constructed with larger and better works, and when the vein was again reached a large number of very rich deposits was found. The gross yield of the various

mines during this entire period was as follows: Ophir, \$20,000,000; Savage, \$16,500,000; Hale and Norcross, \$11,000,000; Chollar and Potosi, \$16,000,000; Gould and Curry, \$15,000,000; Yellow Jacket, \$16,500,000; Crown Point, \$22,000,000; Belcher, \$26,000,000; Overman, \$3,250,000; Imperial, \$2,750,000; and Justice, Kentucky, Sierra Nevada, and many others, from a hundred thousand to more than a million dollars. By 1865 the total bullion yield of Storey County, most of it from the Comstock, was about nine and a half million dollars. During the first twelve years after 1859 the production of all the mines on the Comstock averaged a little over \$12,000,000 annually, or a total of \$145,000,000. The actual yearly yield, however, fluctuated greatly; it rose to seventeen or eighteen millions and sank as low as two millions. Work went on with undiminished zeal in every mine on the lode during all these twelve years, and those mines that were in borrasca kept going by means of their monthly assessments.

According to modern methods of managing rich mines, this enormous yield ought to have made some stir abroad, but it hardly seemed to cause much excitement. Conditions which prevailed on the Comstock were such that the larger part of every bonanza went into running and extraordinary expenses. I have described a few of the costly mechanical developments required, but all along the line magnificent enterprise and the most reckless waste went hand in hand, particularly in the four or five years after 1860. Money was spent lavishly; wages were very high, cost of living was enormous, and the miners had the best of everything. Behind all this, tens of millions of dollars went for experiments with mills and machinery. As for salaried officials, the number of relatives and friends

that the owners of the famous mines managed to support by obtaining them sinecures will never be known. Clerks by the score were paid with Comstock silver until, as the writer of the time casually remarks, "it seemed as if half the young men in San Francisco were directly or indirectly supported by the Nevada mines."

How great was the total of this astonishing wastefulness may be gathered from a few statistics. The grand old Ophir, after taking out \$15,000,000, had paid only \$1,400,000 in dividends. Half a million, to be sure, was in the new Washoe Valley mill, and perhaps a million in machinery on the mine itself, but the rest went for salaries, labour, and "supplies." The last elastic word had to answer for many missing dividends in every mine of the epoch.

As far as Virginia City was concerned, an assessment mine was often nearly as good as a dividend mine. Every one in its employ received just as high wages, paid with as much promptness, as the wages at the other mines. Lumbermen, freighters, merchants, had almost as much support from a mine that was in borrasca as from one in bonanza, provided that the borrasca did not prove so continuous as to cause the stockholders to quit work. It was generally thought as cheap to keep on doing something as to let the mine go to ruin and the machinery become worthless. Whether the advance drifts were in barren feldspar, in pay ore, or in bonanza, the great mines went on summer and winter alike.

I have already illustrated the expensive processes by which the rich ore of the first line of bonanzas was wasted, in a previous chapter, by reference to the useless Gould and Curry mill. In those days the stockholders of the mines walked the streets of Virginia City "as if pacing the roof of an unfathomable treas-

ure-house," says Mr. Eliot Lord, "and their heads were continually in the clouds. They saw a network of silver beneath their feet and the fine strands widening into solid wedges of ore." No metaphor can exaggerate the prevailing delirium. "Men were drunken with the wine of sudden success, and scattered their money broadcast." A superintendent of Overman filled his water tank with champagne for his guests at a wedding. Another Nevada mining man put door handles of solid silver throughout his entire house. The works, offices, residences, and stables of officials were constructed on a scale of expenditure that would have befitted an Oriental prince. Terraces, fountains, thoroughbred horses, libraries in morocco "bought by the foot" like silver ledges, the costliest of whatever can be worn, drank, or eaten—these were counted among the necessities of existence.

When the free-handed Californians led in such lavishness, the few old-timers who were left soon caught the pace. One of these was Sandy Bowers, once a Gold Hill placer miner, whose claim was ten feet on the Comstock. A washerwoman who was in the camp owned ten feet adjoining. Bowers married her, and in a year or two, their ground proving to be in the heart of the surface bonanzas, they became extremely rich. Bowers began in 1861 a stone mansion which finally cost him \$407,000. While the contractors were at work upon the house the wedded pair went to Europe, spending three years there with great comfort to themselves. Before they left, Bowers hired the International Hotel and gave a banquet to nearly the whole of Virginia City. Every luxury that San Francisco could furnish was ordered for the occasion. Bowers's speech was long quoted on the Comstock: "I've had powerful good luck in this country, an' now I've got money

to throw at the birds. Ther arn't no chance for a gentleman to spend his coin in this country, an' so me an' Mrs. Bowers is goin' ter Yoorup to take in the sights." He proceeded to explain that there were few or no people worth seeing in America. He considered Horace Greeley worth looking at, "likewise Governor Nye and old Winnemucca." But what he had really set his heart upon was to see "the Queen of England and all the other great folks of them countries." Sandy Bowers continued to throw his money at the birds—chiefly birds of prey, as may easily be conjectured. He died in 1868, the mine ceased to pay, and Mrs. Bowers, reduced to poverty, became widely known as the "Seeress of Washoe," the most popular fortune-teller on the Comstock.

During the first few years of the Comstock the dominating individual was undoubtedly the well-known William A. Stewart, afterward United States Senator. He was a man of large plans, immense fertility of resource, and unblenching courage. Burly, frank-spoken, powerful mentally and physically, he was said by the Gold Hill News to "tower above his fellow-citizens like the Colossus of Rhodes" and to "contain as much brass in his composition as that famous statue ever had." If the flush times had continued, one can hardly see how the authority of "Bill Stewart of Nevada" could have been shaken. But the times when the control of a great mining district passes from one man or set of men to others are undoubtedly the times when bonanzas fail and stockholders begin to despair. Then occurs a general readjustment, and new men force themselves to the front as captains of industry.

Ophir, which had spent a million dollars or more in litigation over a piece of mining ground that it afterward bought for seventy thousand dollars; Gould and

Curry, whose bonanza was plainly at an end by 1864; Savage, and others of less importance—these began to retrench in every possible way. The trained business man began to be in demand; the virtues of adversity began to be developed. The wild and passionate mining-camp leaders, whose impulses were as strong and fierce as the waves of the ocean, were slowly giving way before a new epoch—that of the close organization of capitalists for motives of self-interest. Gone were the Comstocks and O'Rileys, gone was old Finney, the Rip Van Winkle of Washoe. Going, too, were the early Californians, the supplanters of the first Comstockers, the early mill-builders, the first lumberers in the Washoe foothills, the men of the first line of bonanzas. They had spent too royally; the mines were in borrasca, money was scarce, and every one was in debt.

A small, quiet, reserved man, a born financier—William Sharon—became in the spring of 1864 the manager of the branch of the Bank of California at Virginia City. It is said that he had devoted much of the preceding year to study of the Comstock; he had lost a moderate fortune in stocks, and was anxious to recover himself. For several months before his appointment he had been a private financial agent of Ralston's, and had saved large sums to the bank. Though almost unknown, a few men saw in him the coming master of Nevada.

Local banking houses were lending money to business men and mill owners for from three to five per cent a month; Sharon offered loans on the same security at two per cent, and made large advances on these terms. While the mines were turning out ore the mills could easily pay such interest and make money, but as soon as the ore product was checked and

the music of the stamps ceased, the mill owners were in trouble. A mill in White Pine district that had cost \$200,000 was once vainly offered, when in perfect condition, for \$5,000. Sharon himself once sold a mill for \$3,000 that had cost him \$60,000, the original loan, and interest. Here in the shadow of dull times along the lode were the beginnings of what the public soon called "an infamous, fortified monopoly system." The bankers became the mill owners, and ultimately managed to control the mines also. Sharon's opportunity came through the few years of leanness in the producing mines.

Mill after mill fell into the hands of the Bank of California until seven large and well-equipped quartz mills with all their water rights, contracts, and privileges belonged to that institution. Sharon had investigated every mine on the lode, and believed that there was a future for the Comstock far brighter than the past. Ralston, though always a daring operator rather than a banker, felt doubtful of the future of the mines. If they should fail, the abandonment of the district was sure to follow, and not only the large sums he had advanced upon milling property, but the equally large amounts loaned to mining companies (not to individuals) would be entirely lost. The security was practically ore (as yet undiscovered); none of the mine owners were personally responsible under the laws of that period for company debts. Mills, machinery, all the towns of Nevada even, were not worth tuppence if the fissure, so barren at the levels being worked in 1865, continued barren much below that depth. An absolute collapse of the mines and all interests dependent upon them was looked upon as a not unlikely event. Large owners began to try to sell, with the usual result of breaking the stock market completely.

At this time Ralston visited the Comstock. It presented a melancholy picture of a mining camp in eclipse, and he became very uneasy at the situation. How much the Bank of California then had invested is not known, but it was said by Mr. Sharon, years later, that at one time before 1870 three million dollars of the five million dollars capital of the bank was loaned on the Comstock. The leading bank of the Pacific coast had virtually become a mine-supply company for a group of silver mines in Washoe! It already controlled some of the mines at the time the mills began to fall into its possession, and, upon Sharon's advice, the policy of conquest was pursued with redoubled energy. The bank in the hands of Ralston and his friends was liberal, enterprising, speculative, and at times enormously profitable, but it was managed in a spirit that was far removed from safe commercial methods. One may even say that the whole reckless audacity of the mining era of the Pacific coast found its apotheosis in the history of the Bank of California, and its typical men in Ralston and his group.

Sharon advised that a corporation should be organized by some of the leading men of the Bank of California to buy and manage the mills which had come into its possession, and that these men (who were already holders of much mining stock) should concentrate their energies upon such mines as were producing or likely to produce ore for milling. The possibilities of profit to this company in case of new ore bodies being found were very great, for they would be making contracts with themselves whenever they sent the ore to a custom mill. In June, 1867, therefore, the famous Mill and Mining Company was formed by W. C. Ralston, William Sharon, Alvinza Hayward, D. O. Mills, and others. They were soon called the "fortified mo-

nopolists," and nearly all the vested interests of the State of Nevada other than their own were soon arrayed against them.

There are but two systems of handling ores: each mine can own its own mill, or it can send its ores to a custom mill. In the one case the mine owners build and carry on the mills, managing them through salaried employees; in the other they contract with the lowest bidders who can and will guarantee fair returns. Both systems have drawbacks. On the Comstock the experiment made by some mines of building their own mills had been a sad one; the free, energetic mill owner became a more efficient ore-worker than the hired mill superintendent. But the Comstockers did not protect the permanent interests of the mill men to whom they owed so much. What Prof. Raymond has called the piratical policy of gutting the mines was carried on at such a shocking rate of speed that it first unduly stimulated the building of mills and afterward left the mines totally unable to sustain any of them.

Ralston's Mill and Mining Company in two years was the owner of seventeen mills, some obtained by foreclosure of mortgages, others by purchase. While outside mills could not make a living, those of the syndicate were kept running night and day, crushing nearly all the ore of the region. Naturally, the syndicate fought everything that threatened to reduce its profits or check the progress of its plans to become absolute master of the Comstock and its allied interests. It fought Sutro, because his tunnel might permit outside mills on the Carson River to work ore even cheaper; it fought the independent mines and mills; it entered politics and fought against certain laws and for other laws after the manner of similar syndicates the world over. It began to hedge about the free Com-

stock miner, and slowly but surely all men became aware that the substitution of the Sharon group for the Stewart group as the leading personal influence in Nevada was a complete revolution—the greatest that the sagebrush land had yet seen.

During this period of depression, when the Comstock lode fell measurably into the hands of this small group of Bank of California men, almost the first scheme of Sharon and his associates was the building of a railroad to connect the mines with more distant mills owned by the syndicate, and both with the main Central Pacific line. It was an old idea, like everything else, long rolling about—a mere tumble-weed of the desert. Legislatures, both Territorial and State, had granted charter after charter to different parties who agreed to build railroads after a manner which looked excellently well on paper. But these premature and miscellaneous projects of universal railroad building in that wild mountain land were without definite purpose, and soon sank into a state of innocuous desuetude.

Then Sharon, the man of affairs, sent for the best mining surveyor on the Comstock. This was Superintendent James, of the Sierra Nevada Company. The conversation that follows is from his own statement. Sharply, and without a word of explanation, Sharon said:

“James, can you run a railroad from Virginia City to the Carson River?”

“Yes.”

“Do it at once.”

The next day a party of surveyors were in the field along the mountain trails and highways. In a month the twenty-one miles of the route were mapped out, grading had been already commenced, and the rails

had been ordered in England. Sharon himself had not been idle. He had formed his company, had bought out the necessary rights of those who had several moribund charters, and had obtained from the Legislature a new charter. More than this, he had secured legislative authority for the issuance of \$500,000 in bonds by the counties of Storey and Ormsby as a free gift to the railroad. It is needless to add that the counties duly issued the bonds, and without making any conditions whatever. The mining companies on the lode subscribed \$700,000. Rather a busy thirty days this, and well worth noting as an instance of Comstock energy.

Before April 750 men were at work, and by May 1,200, distributed in thirty-eight camps, strung along the line from Carson to Virginia City. Other gangs were hewing ties in the Sierras. On September 28th, the English rails having arrived, the first one was laid, and on November 12th the first engine reached Gold Hill. The road cost \$1,750,000, and as much more was spent the next year in extending it to a junction with the Central Pacific at Reno.

What the engineers had done in the construction of this little railroad was to lay out a line with a grade of about 1,600 feet in thirteen and a half miles. The maximum grade is 11.6 feet to the mile, and the curves of the road in thirteen and a half miles of mountain distance make seventeen full circles of the track. It justly ranks as one of the noteworthy achievements of American mining camps.

Trouble followed fast enough: the fine old silver freighter, in Nevada slang the mule-skinner, the bull-puncher, swinging his oxen around the logging camps west of Washoe Valley, even that aristocrat of the fraternity, the lordly "silk-popper," flicking his play-

ful whip at the leaders as he skilfully steered his loaded stages along the precipices down Gold Cañon to Silver City and Dayton—these, all these, after loud complaint and unavailing struggles, went their ways into the un-railroaded distance in search of new camps. “Sharon’s iron mules,” as they said, were too much for them. Some teamsters redoubled their efforts, determined to “beat Sharon or bust.” One “train” hauled to John-town in 1870 weighed, according to the Gold Hill News, 90,690 pounds, including the wagons; the ore alone weighed over thirty-six tons. But the locomotive beat them, for the engineers sought to surpass each other and made some astonishing records for the freight engines then in use. Finally a fourteen-horse team fell over the grade, breaking up the wagons and disabling the horses, and the freighters reluctantly retired from the unequal contest.

Cost of transportation was decidedly reduced by the railroad. Ore went to Carson for two dollars a ton where before it had cost three dollars and a half, and this made it possible for the mines to work lower grades of ore, long thought too poor to pay expenses. Cord wood fell from fifteen dollars a cord to eleven dollars and a half. As many as forty-five freight trains went daily over the road. The mines, the mills, the freightage, were now in the hands of the syndicate, and it began to reach out to control both the timber supply and the water supply of the Comstock.

Meanwhile the real condition of the mines had been a constant source of profound anxiety to Sharon and his associates. None knew better than they did that although borrasca had put them into possession, a few more years of borrasca would utterly smash their fortunes. They had acted with singular discretion and energy, had originated and carried out great concep-

tions, had dared to build their railroad in the darkest hour of their enterprise. What next? They held many an anxious consultation about the mines. The bullion product of the lode which had been \$16,000,000 in 1865 fell to \$11,739,100 in 1866, rose somewhat the next year, fell heavily to \$8,499,769 in 1868, and still further to \$7,528,607 in 1869. Fewer tons of ore were being raised, and the ore was of lower value. The "bonanza raisins" in the great Comstock plum pudding, to use a comparison once made by John W. Mackay, were taken out, and, so far as any one knew, there might be no more. In fact, the most experienced miners now held that any future deposits of ore would be smaller and leaner than before. Mining observations elsewhere had seemed to show that there was a line a few hundred feet down that marked the limit of pay ore. Besides, the Comstock lode was different from any other in the impossibility of tracing much if any connection between one ore body and another. The ores as the mines descended were not only poorer but more refractory, and the quartz "gangue," or vein matter, was changing to carbonate and sulphate of lime, which seldom contained ore.

There had been eleven bonanzas up to 1869, and all of these were now nearly exhausted. Ophir was without pay ore; Gould and Curry and Yellow Jacket were yielding less than one fourth their usual product; at the south end even the richest of the Gold Hill mines were in a bad way. The solitary cause for hopefulness was the fact that a very narrow vein of promising ore, a mere stringer that might develop into something better, had been found in Yellow Jacket in November, 1868. It was on the 900-foot level, and had been carefully studied by all the members of the syndicate, but for some time it led to nothing. A struggle with the

Miners' Union and a disastrous fire in the mines added still greater intensity to the situation. Some of the members of the syndicate began to weaken toward the end of 1870; it was whispered everywhere that the Comstock had paid its last dividend; the cities on the lode were already trembling upon the verge of panic—when an apparently barren portion of the Comstock became of the first importance.

Crown Point mine, 540 feet on the lode, had paid no dividends for some time; had in fact levied \$240,000 assessments. The superintendent was the noted John P. Jones, since United States Senator, an old Californian who had been in Nevada only a short time. From the spring of 1868 till November, 1870, he had hunted in vain for ore by drifts on the 900-, the 1,000-, and the 1,100-foot levels. Everywhere were barren quartz and porphyry. The stock fell to a price which rated the total value of the mine with its \$140,000 invested in machinery alone at only \$24,000; the owners would not pay another assessment. But late in 1870 the character of the rock in a new drift that Superintendent Jones was running showed slight changes. The hard, gray porphyry that the miners had been cutting through in every direction for years began to grow softer, with streaks of quartz and red, rusty lines. Some two hundred and forty feet from the beginning of the drift a seam of clay was found. They cut this, and soft white quartz was entered which proved to contain small knobs of ore. The value of the stock rose to ninety dollars on the strength of this promise. By May a cross-cut from the 1,200-foot level entered the same formation, and the price of shares went to one hundred and eighty dollars.

Alvinza Hayward, receiving private information, began to purchase at two dollars a share, and finally ob-

tained control of the mine, but he did this as an individual, not as a member of the famous Bank of California syndicate. This was Sharon's first and almost only defeat during his career on the Comstock. The Union Mill and Mining Company lost because Crown Point made contracts elsewhere, and its new owners organized the Nevada Mill and Mining Company as a rival to the Bank of California.

But the lesser defeat was merely an incident of the larger success of Sharon and his group. Every other mine on the lode became much more valuable. Money poured into the emptied treasuries of the mining companies still in borrasca, and the Bank of California was placed out of danger for the first time in several years.

Crown Point was one of the Gold Hill group. Its bonanza increased the total yield of the district from upward of eight millions in 1870 to upward of eleven millions in 1871, and this total, swelled by contributions from other mines that had begun to get into the line of deep bonanzas, was \$13,569,000 in 1872. The total yield of Crown Point between May, 1864, and May, 1877, is estimated as close upon twenty-five million dollars. Crown Point stock reached its highest point in 1872, when it sold for \$1,825 a share—a valuation of about twenty-two millions for a property that only eighteen months earlier had been rated at \$24,000. This shows the popular estimate of the new bonanza.

Thus, as we have seen, the period of litigation over the surface bonanzas was followed by a long and almost universal depression in the values of the various mines, which was suddenly ended by discoveries made in a hitherto barren mass of porphyry. The uses and opportunities of mining adversity were never more evident, for the period of borrasca enabled the Bank of

California syndicate to accomplish what would have been impossible a few years earlier or a few years later. A new group of men had found their longed-for opportunity and had many times multiplied their fortunes by the dangerous venture. Even Sharon in the fullness of his power could not prevent others from sharing in the results of his organizing abilities; and although he had long planned to be master of every bonanza on the lode, through prior information and larger capital than his associates, he was finally conquered by Jones and Hayward in the struggle for Crown Point.

CHAPTER XVI.

DAYS OF THE GREAT BONANZA.

THE discovery of Crown Point's bonanza in 1870 had increased the value of all the mines on the Comstock by about \$45,000,000. A still greater bonanza—the one by which the fame of Nevada was spread abroad in every land and every tongue—was near discovery, even while Senator Jones was running the fateful drift that raised Crown Point stock within a year from \$2 a share to \$1,825 and lifted stock of Belcher, the adjoining mine, from \$1.50 a share to \$1,525.

Even while Hayward and Jones were dividing control of the productive mines of the lode with Sharon and other members of the Bank of California syndicate, two Irishmen, John W. Mackay and James G. Fair, were obtaining the fulcrum upon which to poise and turn to their own purposes the most valuable portions of the whole Comstock lode. Three San Francisco men—James C. Flood, William S. O'Brien, and J. M. Walker—were soon joined with them in mining enterprises. Flood and O'Brien had been retailing liquors in a large San Francisco saloon. Walker soon sold out his interest to Mackay for \$3,000,000, lost it in bad investments, and died in poverty. The others became the four "bonanza kings" of the period, and their rise forms one of the most romantic chapters of mining life in America. It seems to represent in a typical way the splendid and fortunate element that one likes to

think of as belonging to every mining district. It better explains the fascination that abides in the very name "Comstock" than all the strange and interesting details about the mines themselves.

There was a Dublin-born youth of eighteen named Mackay, a shipbuilder's clerk in New York, who was placer mining in California in 1852. He saved a little money and lost it, saved a little more, and moved to Virginia City in 1860. Here he began to run a tunnel on a claim, used up his available funds, and went to work in the Mexican mine as a timberman underground at four dollars a day. That job finished, he swung a shovel and pick for the same wages.

James G. Fair was a Tyrone lad of eighteen when he took the California gold fever. He mined on the Feather River bars for several years, with little success. Then he tried quartz, and became superintendent of a Calaveras mine. In 1860, like Mackay, he went to the Comstock, and was made superintendent of the Ophir, on a good salary, of course, but otherwise, seemingly, as far from the ultimate ownership of any mine on the lode as the most ordinary miner under his supervision.

In 1860 both Fair and Mackay (like John P. Jones, the discoverer of Crown Point bonanza) were poor and obscure men. Finney, Comstock, O'Riley, McLaughlin, and the rest of the first owners of the lode had much more money and far better opportunities than Mackay, Fair, or Jones, who became the three most famous miners of the district, and, it is no exaggeration to add, the three leading silver miners of America. Flood and O'Brien were mere speculators, not miners. They paid assessments, but did nothing else to find and gather the golden harvest. Flood developed great financial ability, but O'Brien was, and remained till the day of

his death, a very commonplace individual of mediocre talents.

Sharon had come to the Comstock with capital in his control, so that at one time it was said he directed the management of every productive mine and every operating mill, besides the waterworks, the lumber supply, and the railroad—altogether some twenty-five million dollars of real property aside from stock values. The new bonanza monarchs, Fair and Mackay, were about to raise a piece of seemingly barren territory, neglected and despised by Sharon, to the rank of an independent and more powerful kingdom, so that the Bank of California syndicate, rapidly recovering from the blow dealt it by the defection of Jones and Hayward, was to be permanently made a “second-rate power” on the Comstock.

Mackay and Fair, even as young men, deserved large success as far as constant labour and study and steady habits may be said to deserve it. One easily sees that both were strongly imbued with the narrow but powerful ambition to become extremely wealthy; that each in his especial line of work—Mackay as a miner, Fair as a mining superintendent—saved all he could and speculated with it for the sole purpose of becoming a mine owner; and, finally, that both were very hard students of mines and of everything connected with mines. When they met, each recognised in the other a kindred spirit, and they immediately joined forces.

But Mackay outranks the rest of the Comstock leaders, because his rise was more remarkable and his grasp of circumstances more firm. From a day labourer toiling in the lower levels he became superintendent of the Caledonia Tunnel and Mining Company. This was at Gold Hill. It had a hundred thousand shares,

had yielded by 1878 \$345,000, and had assessed its stockholders nearly a million and a half dollars. A few years later he became one of the principal owners of Kentuck, a very rich mine ninety-four feet on the lode, which up to 1880 had paid \$952,000 in excess of dividends over assessments. Beyond a doubt, this purchase was made because of Mackay's rare and valuable faculty of discerning the best time to buy or to sell mining stocks. His cool brain, long weighing the chances of every inch of explorations in any mine he thought of speculating in, was steady in the midst of wildest excitement. His own statement is that he sought with all the powers of his mind and body to become "master and manager of the greatest mines in the world." Mackay's swift imagination and sanguine temperament, controlled by his ambitions, were secretly on fire with the possibilities he saw in the great lode. He dreamed and toiled, hoping to win in some way such power as Sharon had. Somewhere in that mountain mass, pierced a little way here and there by pin-holes of drifts, there doubtless lay another bonanza. But in which mine?

After Mackay became part owner of Kentuck he received large dividends and was able to make another move. Hale and Norcross has been mentioned frequently in these pages. It was a mine from which much was hoped by the most competent authorities. It had immense unexplored territory and its equipment was unsurpassed. Mackay and Fair studied this mine; watched its shares rise early in 1868 from \$1,260 to \$2,100; saw also a complete collapse, until by September the price was less than forty-two dollars a share. This gave them a chance, and they controlled the mine at the annual election in March, 1879. Fair, leaving the Ophir, went in as superintendent,

and in a few months it was again on the dividend list.

Old Comstock miners still speak with admiration of the "fine nose for ore" that Fair displayed as superintendent. His watchfulness, energy, and strictness of discipline were never surpassed in the mines of the period. He knew every inch of the miles of underground workings as well as the rooms of his own house, and far better than the miners themselves, each of whom stays on the level to which he is assigned. The new Hale and Norcross bonanza which he discovered and worked out at this period paid \$728,000 in dividends in 1869 and 1870, more than half of which, of course, went into the pockets of himself and his partners.

One barren section of the lode is between the Gold Hill group and the Virginia City group of mines. On about twenty-five hundred feet here mere assessment work had sunk several million dollars; the stock was consequently at a very low figure. Mackay had always wished to conduct a thorough exploration of one of these barren mines. In 1869 he put money into Bullion and became its superintendent. Fair, a year later, was elected superintendent of Savage, still retaining his interest in Hale and Norcross. Four mines of note were now controlled by Mackay, Fair, and their allies; and they were too shrewd men not to get back all their investments as long as there was a stock market. Bullion, however, was always a badly named mine; no bonanza was ever found there, nor in Savage. The Bank of California group of operators began to feel better; it had not been much of a storm anyhow. In a few years more the million or so that Mackay, Fair, and the others had made by accident or by speculation would be sunk in unproductive mines. Mackay would be back in the face of a drift at four dollars a day; Fair,

who was somewhat of a superintendent, could be made very useful if he would only give up his notions of being an independent owner. Meanwhile the Mackay firm, weakened financially but still undismayed, were determined to thoroughly explore another portion of the Comstock.

At the North End, between Ophir and Best and Belcher, there was a long-neglected chain of small locations occupying in the aggregate 1,310 feet. Only very small deposits of pay ore had been found in this group, near the surface, and the owners had lacked capital for extensive explorations. Still, the neglected 1,310 feet lay in the midst of rich property. Beginning at the north end of the Comstock and coming south, toward Gold Hill, Sierra Nevada held 3,300 feet, and, although paying no dividends, was being magnificently conducted, exploring every foot of its territory, and had its great shaft well down in the second thousand feet of distance. Next came Union Consolidated with 600 feet, followed by Mexican, of equal size. Ophir, which came next, held 675 feet. South of Ophir were the 1,310 feet of neglected claims. Still farther south, adjoining these claims, was Best and Belcher with 224 feet; then Gould and Curry's 921 feet of very rich ground, followed by Savage with its 800 feet, and this again by the 400 feet of Hale and Norcross. Here were two great groups of paying mines, equipped in the best manner, controlled by millionaires, and able to continue operating through a long period of borrasca. It is one of the most curious facts in the story of the Comstock that this little row of long-despised claims, flanked on either hand by great rich and prosperous mines, should have sat so long disconsolate, a mute Cinderella in ashes of pioneer hopes.

In the course of time several of these minor claims

were united into Consolidated Virginia, 710 feet on the lode. Then the new owners spent \$200,000 in vain prospecting till the shareholders refused to pay another assessment. By February, 1871, actual sales showed that the mine was worth only \$26,000, or less than a quarter of the price of the machinery. As for California ground, the 600 feet between Ophir and Consolidated Virginia, it had now sunk even lower in public estimation. The entire 1,310 feet was a bankrupt piece of property worth in the market less than \$40,000, as shown by occasional sales; really not worth half so much, good operators said, for an investment or as a speculation.

Mackay, Fair, Flood, and O'Brien, regretting their losses in Bullion, had resolved to stake their fortunes upon the exploration of this comparatively virgin ground to great depths. The four operators began to gather in stock, but even the most consummate skill and caution could not secure control at the lowest figure—that of less than \$40,000 for the whole 1,310 feet. They paid, it is said, about \$100,000 before they were satisfied to announce their control, by which time they had about three fourths of the stock of both California and Consolidated Virginia locked up in their safes, and they took possession in January, 1872.

The new mine owners first turned their attention to the development of the 710 feet known as Consolidated Virginia. During 1872 they levied assessments to the amount of \$212,000 upon Consolidated Virginia stock and spent it all in development. They sank a large shaft and pushed a drift north from Gould and Curry through Best and Belcher (1,167 feet below the surface) into the ground of Consolidated Virginia. This was done, of course, under especial arrangements with the owners of those mines.

Fair was superintendent, and at last, in driving this costly drift through barren rock, his experienced eye discovered a slight change and a narrow seam of rich ore hardly thicker than a knife-blade. He ordered the men to follow it with the drift inch by inch through the vein matter. They did so, even where only a film of clay showed where the thin ore streak had "pinched out." After a while the slender clew was again picked up, and so Fair and his workmen followed the dark line of silver sulphurets through the labyrinths for hundreds of feet. Fair became ill, and the drift, though managed by old and experienced miners, was run far east of the clew while he was absent, but on his return he went back and picked up the ore thread. The drift was now a hundred feet into Consolidated Virginia without anything of importance having been found. The value of the mine, which had greatly increased when the four bold speculators gained control, began to decrease, and it was thought that outsiders would hardly stand another assessment.

While matters were in this condition and people were saying that the daring operators had come to grief, the metallic film so long followed by Fair with his "fine nose for ore" rapidly widened to a seven-foot vein averaging sixty dollars to the ton. Cutting across this vein and extending the cut at each side, two narrower veins were found. After a month's further progress the main vein was twelve feet wide. The shaft which was to reach this ore body was being pushed night and day until early in October it reached the desired point, and the exploration of the ore body was then carried on with system. Where the shaft struck ore, at the depth of 1,167 feet, the width of the body was now forty feet. The miners were not yet "in bonanza," but they felt themselves very near to it. Plenty of pay

ore was in sight, and they had an ore body of unknown size to explore, measure, and assay before taking it out. Running a drift southeast from the bottom of the shaft for two hundred and fifty feet, it cut into a very rich body of ore, a true bonanza, as they knew at once, though they were of course ignorant of its extent.

It was high time to have some recompense for years of costly and unremunerative exploration. On October 16th the skilled and athletic miners began to "breast out" and extract the ore in the chamber. By the end of the month they had hewn out a space twenty feet high and fifty-four feet across the bonanza, supporting it with square sets of timbers as fast as they removed the ore. They had also extended the drift one hundred and forty feet farther through the vein, and every inch of it was still in ore. The sides, the floors, and the roofs of chamber and of drift assayed everywhere at rates that ranged from \$90 to \$630 per ton. The top had been pried off from Nature's huge treasure-vault.

October was a month of such work as had never been seen before on the Comstock or in any other mine known to history, and it was only the beginning of still greater exploits of disciplined labour, as shifts of brawny men, stripped to the waist, toiled in the depths in the way that sailors toiled at Trafalgar between the decks of fighting ships of the British line. The shaft was sunk steadily three feet a day, and at the 1,200-foot level a drift showed that the ore body continued and grew wider. By this time it began to be said in Virginia City that the Consolidated Virginia "had a good mine." That was all. The matter was kept so quiet that no excitement occurred in the stock market. The directors had met, however, and had increased the capital stock of Consolidated Virginia to

108,000 shares of \$100 each; they soon put the California upon the same basis, and retained control in both mines. Consolidated Virginia was taking out two hundred tons of ore a day at the close of October, and in a short time the bullion shipments were \$250,000 a month.

The work of exploration went on, and the immensity of the ore body was more and more plainly revealed through the winter of 1873 and the spring and summer of 1874. The bonanza was cut across at a depth of 1,400 feet, and also at the 1,500-foot level, in 1874. Here the ore was of such unparalleled richness that for the first time the outside world of mining men and speculators began to talk about it. How much farther it might extend in depth or width, or how many of the North-End mines might finally be found to have a slice of it, not even the skill of the four bonanza owners could determine. But so carefully and steadily had the work progressed that no one had been startled by the sudden development. The richest hoard of gold and silver that had ever dazzled the eyes of a treasure-seeker caused for a time less excitement than the every-day strikes in small mines.

The truth is, Mackay and Fair were not interested at this time in the stock market. They had control, and all they wanted was to be let alone. They were not speculators any more; they were simply miners; neither of the mines were for sale, nor did they care to buy any more mines. Their restless ambitions, so long unfulfilled, wished to reap golden harvests from acres of ore. There was so little attempt at concealment, in sharp contrast with the course that had been pursued in regard to the earlier bonanzas, that it is probable this really caused the apathy that long prevailed among the masses of stock speculators. When

the capital of Consolidated Virginia was increased to 108,000 shares they sold at about forty-five dollars, gradually rising to par value (\$100), and early in November, 1874, to \$115. Shares in California were much cheaper, and in September, 1874, had only reached \$37.

There were "short turns" and speculations numberless in the stock during the year and a half that followed the ore-find of March, 1873, but, all in all, the inability of the stock speculators, both leaders and masses, to comprehend the greatness of the discovery seems inexplicable. It is better to reverse the point of view and say that we have in this fact another fine illustration of the uncertainties of mining. Sharon and all his group of allies, and the shrewdest of outside San Francisco speculators, thought for months that the gigantic energies spent in further explorations in Consolidated Virginia was because the ore body was not very large after all, and because new deposits were being sought for. As soon as they became convinced that the bonanza was really unprecedented in magnitude they hastened to buy heavily, but by this time the general public had been roused to a sudden fever of excitement and the value of the famous mines rose every hour on the stock boards. In December, 1874, Consolidated Virginia reached \$610 per share, rising again in January to \$700, which made the selling value of the mine \$75,600,000. California stock went even higher, for it was said that the bonanza extended over from Consolidated Virginia in such a way as to give the California mine the larger part. California shares worth \$37 in September rose to \$780 in January, 1875, making the valuation of that mine \$84,240,000. The 1,310 feet on the lode which had been valued five years before at forty or fifty thousand

dollars was now worth in the market, according to stock sales, about \$160,000,000.

Leaving the stock market, let us return to the depths of Consolidated Virginia. During 1874 the miners had been searching systematically through the ore bodies. They made drifts and crosscuts on each level, extending their work far north into the California; they made winzes from level to level to use in removing ore. They proved that the width of the mass was from one hundred and fifty to three hundred and twenty feet, and that the richness continued without abatement through drift after drift, level below level. The ore output increased, and a dividend of three dollars a share declared in May, 1874, had been followed by others. "The scene within this imperial treasure-house," writes Mr. Lord, "was a stirring sight. Cribs of timber were piled in successive stages from basement to dome, four hundred feet above, and everywhere men were at work in changing shifts, descending and ascending in the crowded cages, clambering up to their assigned stopes with swinging lanterns or flickering candles, picking and drilling the crumbling ore or pushing lines of loaded cars to the stations on the shaft. Flashes of exploding powder were blazing from the rent faces of the stopes; blasts of gas and smoke filled the connecting drifts; muffled roars echoed along the dark galleries; and at all hours a hail of rock fragments might be heard rattling on the floor of a level, and massive lumps of ore falling heavily on the slanting pile at the foot of the breast."

When the fifteen-hundred-foot level was reached and the ore cut into was richer than ever before known on the Comstock, the Territorial Enterprise, of Virginia City, came out with double-leaded columns, under the heading of Heart of the Comstock. Of the lowest cross-

cut the Enterprise said: "It has been bored into the bonanza through a mass of chloride and sulphuret ores which excites the imagination of all beholders. It is now in two hundred and five feet, ninety-five of which is in the extraordinarily rich ore of which so much has been heard. In this crosscut was encountered, a day or two since, the stephanite, a species of ore that is almost pure silver. At the distance of one hundred and eighty feet from the crosscut a chamber of about ten feet each way has been excavated. Its walls on every side are a mass of the finest chloride ore filled with streaks and bunches of the richest black sulphurets. It looks as if the whole mass grew richer with every foot of the advance." Ores of this kind assay up into the thousands of dollars, but it seemed impossible that such large masses of silver should have been deposited, even in the Comstock, so the Enterprise reporter brought his estimates down to one hundred dollars a ton, reduced the size of the deposit, and figured out \$116,748,000 in sight.

It is no secret on the Comstock that this reporter was William Wright, widely known on the Pacific coast as "Dan De Quille," one of the best living writers on mining subjects. He had been through and through the mines hundreds of times, and had really made the reputation of the Enterprise for accurate mining news. There was no one else to do his work; if he went away for a vacation, the proprietors were pretty sure to telegraph that his substitute "was getting fooled every day underground," and he had to hurry back again. He was the first outsider to see the great ore body, and his own account of the circumstances under which he received an invitation to examine it is very characteristic.

"The San Francisco newspapers," said he when

interviewed, "had been saying for a long time that there was no ore in Consolidated Virginia; that people were getting up a stock deal. Some of us happened to know, however, that Fair had been quietly taking ore out of the mine through the old Bonner shaft. One day he drove up to the Enterprise office and came in.

" 'Those city papers have been abusing us long enough,' he remarked; 'I won't stand it! Where's Dan? I want him to go down to the mine. I'll show him what we're doing.'

"This was before any one had definite knowledge of the strike. It was before the Enterprise had printed anything important, you understand—only rumours or street talk. When I had been in the mine before I could not get into those drifts. Fair spoke pretty loud, as if he only wanted to shut up the city papers, but probably he had all the stock he wanted and had just got ready to tell the truth; I don't know. Anyway, I jumped up and ran out when I had the word; you never saw a reporter go faster. We drove to the mine and went down to the richest place in the bonanza.

"Fair said: 'Go in and climb around. Look all you want, measure it up, make up your own mind; I won't tell you a thing; people will say I posted you!' And so he went away. That just suited me. After I was through I went to the Enterprise office and wrote two articles, one of which you have just quoted from. That was the first authentic account of the big bonanza, and that was the way the Enterprise had a scoop."

A little later a visitor to the mine "stood where the miners were digging ore, and looked a hundred feet upward and on each side across the ore body. On all sides of a pyramidal mass of timbers, growing larger

each moment under the toil of busy hands, were twinkling stars of lamps where men were hewing at the sides and ceiling." Often the sides of the huge cavern glistened as if set with silver; but this was not silver—only crystals of iron and copper pyrites. There were also great masses of blue, purple, and white crystals of quartz, some of them weighing many pounds, with crystals several inches long. The miners say of a vein that contains such crystals that "it is alive" and think that the best of signs of a large bonanza. Chloride silver ore is pale-green and steel-gray in colour. "Silver glance" is black and lustrous. The general colour scheme of the great bonanza, despite an occasional glitter of crystals, ranged from bluish gray to deep black.

All of the contents of the bonanza were sent to the mill just as it was blasted or hewn out. Some of the ore was so rich that waste rock and low-grade ore were mixed with it in order to work it better. An average block of ore three feet square contained from three hundred to five hundred dollars in silver and gold. Even in the widest part of the ore body, three hundred feet across, the entire contents were milled without assorting. Some of the richest ore was near the line of the California mine, where a mass of porphyry crowded the ore into less space. The silver here was often in the form of crystals of stephanite, or in bunches of pure and malleable silver, in coiled wires, and in silver crystals. There is hardly any more beautiful sight in a mine than a "nest" of wire gold or wire silver gleaming in the dark sulphurets. A few of the more exquisite combinations of metals and crystals that occur at times in mines of the first rank are still preserved in cabinets, but by far the greater part have been destroyed, sent to the mill if valuable mineral, or to the dump heap if

unremunerative. Old miners in some of the famous mines tell stories of cavities as large as an ordinary room into which a drift will sometimes break; cavities set thick with rock crystals of every beautiful colour known to the mineralogist—white, pale pink, olive-green, rose, purple, or violet. In such a glorious place it seems, even to the ignorant miners, as if the jewel caskets of monarchs had been surpassed, for here Nature has the hues of sapphire, emerald, tourmaline, amethyst, chrysoprase, opal, and lapis lazuli. Such crystal rooms are extremely rare, and more often occur in New Mexico and Sonora than in Nevada districts. One ore chamber ten feet square, situated about fourteen feet south of the California line, seemed to Comstockers the richest part of the lode, and many specimens of ore from here were saved for collectors in various parts of the world.

Now that the Pacific coast was stirred with the great news, estimates of the actual "ore in sight" began to be in order. I have alluded to the first newspaper estimate of about \$116,000,000. Next came Mr. Diedesheimer, the inventor of the "square-set system" and one of the most careful mining engineers on the Pacific coast. He reported to the directors that there was \$1,500,000,000 in sight, and added that each mine ought to pay in dividends \$5,000 a share under proper management. A little later he gave proof of his faith in his own report by putting every dollar he could raise into shares in the two mines at the highest price. Even the director of the Carson mint, with his assistants, who examined the bonanza, was unable to fix any definite limit to its yield, and thought there was not less than \$300,000,000 already in sight. Mackay, however, a miner of unsurpassed judgment, utterly refused to make any estimate, and

flatly said it was an impossible task, because barren masses of rock, porphyry, the difficulty of obtaining accurate assays, and many other elements of uncertainty made calculation absurd. He "preferred to mine it out first and then take the milling returns."

The public made loud demands for estimates, and for a thousand other details, often beyond the power of human ability to satisfy. Whatever was said or was left unsaid, the men who controlled the bonanza were abused and misrepresented. That was a part, and no small part, of the price they had to pay for their fulfilled ambitions. Powerful though Mackay and his companions were in their own field, neither they nor any other men could control the genius they had released from the casket of the bonanza. The actual available capital of the Pacific slope that could be put into mining ventures in January, 1875, was not greater than \$20,000,000. To tie up more than this in such investments or speculations would be to injure and seriously check the growth of the western third of the continent. Now, as I have already shown, the stock-board valuation put upon the two bonanza mines in that month was \$160,000,000. It is not likely that more than a fourth of the stock was ever in the market, but the entire Pacific coast, as above stated, could not have bought and paid for more than twenty millions' worth.

Then, too, in addition to the immense and probably justifiable valuations put upon the Consolidated Virginia and California, every other mine upon the lode had greatly risen in estimated value. The prices paid in January, 1875, showed that Ophir had risen to over \$31,000,000 because it was next to the bonanza mines; Best and Belcher was rated at nearly \$9,000,000, and Mexican a trifle higher; Gould and Curry, Savage,

Exchequer, Yellow Jacket, Overman, Bullion, Crown Point, and several others were valued at from three to twenty millions apiece. It made little or no difference where they were located. Indeed, the theory was now held by most speculators that every so-called "barren" place in the lode would prove to have immense ore bodies somewhere below the thousand-foot level. The total valuation of all the mines on the lode at this date was \$393,253,440. How much gold coin would really have been needed at this time to buy not merely the floating stock in the market, but also enough to control every mine on the lode is hardly to be estimated. There was not enough coin in America.

Evidently, even if all the Comstock mines had been worth the price asked, California and the rest of the Pacific coast did not have a tenth part of the available capital to sustain such a valuation. When the transfers at only one of the three stock boards were \$50,000,000 for a single month, it is evident that the pace had been set pretty fast, for prices had now become so high that nearly every one was compelled to buy on a margin; there was not money enough to do otherwise. Naturally the "shorts" had their innings. A few stories that the bonanza had given out started a ruinous panic at the close of February that completely demoralized the money market. Consolidated Virginia fell two hundred dollars per share in a week. California lost sixty per cent of its market value. Other stocks on the lode and outside fell in much greater proportion. The result spelled ruin in large capitals to thousands of families. The Bank of California failed in August of that fateful year, and Ralston, the main-spring of countless enterprises, died in the waters of San Francisco Bay. The entire community staggered

under disasters brought on by wild speculation in stocks. It was the Black Friday of the State of California.

The public charged Mackay, Fair, and their comrades with speculating in their own stocks, and so creating the alternate panics and short-lived booms of the great bonanza period. Books were published—sometimes novels, sometimes bitter essays—that described with the sarcasm and emphasis of a Swift innumerable supposed crimes of the bonanza kings against the rest of humanity. Time, however, has caused many of these hasty accusations to be forgotten. The behaviour of the new-made plutocrats was not essentially worse than the behaviour of the earlier groups of bonanza owners. Mackay, the typical miner of the company, kept himself especially free from outside deals. Later, alluding to the crash in stocks, he said: "It is no affair of mine. I am not speculating in stocks. My business is mining—legitimate mining. I see that my men do their work properly in the mines and that all goes on as it should in the mills. I make my money here out of the ore."

Prices of shares had no influence upon the work in the mines. Through good days and evil the ore yield increased. Consolidated Virginia extracted about 12,000 tons in 1873, producing in bullion \$645,000; in 1874, 91,000 tons, of a milling value of \$4,981,000; in 1875, 169,000 tons, milling over \$16,000,000; and in 1876, 142,000 tons, milling over \$16,000,000. Then the product began to lessen. The exact amount of ore extracted in six years ending with 1878 was 682,385 tons. The bullion product was \$60,732,882. California in 1875 and the three years following extracted 486,043 tons of ore, which gave the total bullion yield of \$43,727,831. Nearly \$105,000,000 was the product

of the Big Bonanza, as Comstockers have always called this body of ore.

As for dividends, everything was done to increase them. The returns to stockholders were unprecedented in the stories of great mining enterprises. By the middle of 1879 Consolidated Virginia had paid fifty-two dividends aggregating \$42,120,000, and California had paid in dividends \$31,050,000. A thousand miners were employed; a new and much larger shaft was sunk. Mills and machinery had been rebuilt and enlarged at great expense. But all other duties had given way to the imperious necessity of taking out ore as fast as possible, so great were the dangers of a frightful accident. Every difficulty met with in removing other bonanzas seemed intensified in this case. The hot clay, feldspar, and ore seethed and swayed as the men worked. Forests of timbers, continually needing care and renewal, were rotting, breaking, and being crushed together. A single spark might make the mine a pit of flame, and probably would so cave and ruin it that it could only be reopened by years of labour and at vast outlay. Mackay, keenly alive to the ever-present dangers of fire and collapse of the supports, left nothing to chance, but inspected the drifts in person night after night. His tireless vigilance had its rewards, for no accident happened until the bonanza was fairly worked out. A few years later fires broke out in some of the abandoned levels of both the mines, and the men bulk-headed all the connecting drifts so as to shut the air out. The timbers smouldered for weeks, and the drifts finally became totally unfit for passage—a very labyrinth of traps and pitfalls shunned by every miner to this day.

After 1879, the close of the bonanza period came with exceeding swiftness. The stock of the thirty

mines on the lode, valued in 1875 at over \$393,000,000, sank in February, 1880, to something less than \$7,000,000. California sold for \$1.25 a share and Consolidated Virginia for \$1.90, and so on down the forlorn list. How had the mighty fallen! The great bonanza, after yielding in five years nearly \$105,000,000, was exhausted, and nothing even approaching in value to the earlier group of ore bodies has since been discovered. Hundreds of thousands of tons of low-grade rock have been taken out of long-neglected portions of the mines and worked at a profit, small dividends have been paid by a few mines, and the working efficiency of the lode has been well maintained. There may be new bonanzas in the depths or new grains of metal hidden in husks of porphyry, but nothing of striking importance has since been found. Once more the endurance of the mine owners and of the towns on the lode is being severely tested. California ceased paying dividends in 1879; Consolidated Virginia paid its last dividend in 1880. Fourteen years of borrasca have ruined successive stockholders, have caused the decay of once-populous mining towns, and have, in short, come near to breaking the hearts of the brave old Comstockers.

CHAPTER XVII.

THE SUTRO TUNNEL.

IN the days when Virginia City was founded there came to the collection of "dug-outs," tents, and brush huts a young man of small means but boundless energy. He was a volunteer in the Pyramid Lake battle with the Indians, and gave one of the most lucid and trustworthy accounts we have of that disastrous affair. He was afterward in business in Virginia City, and in 1861 he built a quartz mill on the Carson River. In a short time he became convinced that a deep drainage tunnel was absolutely necessary to the continued working of the great lode and he advanced this idea on every occasion, until people began to consider him a crack-brained enthusiast.

The notion appeared to most men entirely impracticable. The point at which Sutro wished to see the lode cut by a tunnel was nearly two thousand feet below the surface—much deeper than any miners in the early '60's thought it possible to carry on operations. He scorned the lesser and temporary usefulness of small, short tunnels from the heads of the adjacent cañons; what he advocated was a large tunnel from the floor of the Carson Valley, distant about four miles in a horizontal line from the lode.

It must be explained that a tunnel run into a hill so as to strike the ledge at some point below the surface is either for prospecting and ore-handling pur-

poses, or it is purely a drainage and ventilation tunnel, or it combines to some extent these several uses. A mining country that contains high mountains and short, steep ravines is well adapted to tunnels, or adits, as mining engineers often call them. Sometimes they afford vastly more economical methods of opening up and working mines than by shafts, but, of course, in many cases there is no opportunity for tunnels. Sometimes when a ledge has been well prospected on the surface high up on a mountain the very first thing done is to run a tunnel often several thousand feet long, so as to strike the ledge, and then work up to meet a shaft started from the top. If this is five hundred feet from the end of the tunnel, the miners say they have "five hundred feet of backs." That is, they can take out that much ore by gravity alone, and so can handle it very cheaply.

Three or four years of constant study and active work had already made Sutro a man of note among his fellows in that cyclonic vortex of life and motion—early Nevada. He became widely known as a man of immense capacity for affairs; one who was gifted with unconquerable tenacity of purpose and fertility of resource. He gradually organized the enterprise known by his name, and for twenty years was one of the most interesting figures in the story.

Sutro soon gained the attention of Stewart, Ralston, and others; in fact, Stewart became president of the company organized in 1864 to construct a tunnel after Sutro's plans. The first Nevada Legislature, in February, 1865, passed an act granting a franchise, right of way, and other privileges to Sutro and his associates. The amount of royalty to be paid by the mines that would be benefited by the tunnel was left to subsequent agreement between the Tun-

nel Company and the owners of the various mines. After eight months of strenuous efforts Sutro secured contracts from twenty-three mining companies, representing, it is said, ninety-five per cent of the whole market value of the lode. In these contracts the mines were bound perpetually to pay to the Tunnel Company two dollars a ton for every ton of ore taken out after the tunnel had reached given points so that it could be used. The mines were to also pay a fixed rate per ton for the transportation of waste rock, *débris*, or any material from the mines, and of supplies from outside, besides a certain price for each and every person in their employ who passed through the tunnel.

The only requirement of the State Legislature was that Sutro and his allies should secure three million dollars by August, 1867, and should spend a certain amount annually in the enterprise. As soon as the mines had agreed to the various royalties and payments, which were considered very reasonable by all concerned, it seemed as if the chief obstacle was removed and capital could be secured. At this time, early in 1866, there was unbroken harmony on the lode in respect to the tunnel proposition. Sharon, Ralston, and the newly organized Bank of California syndicate were foremost in approval. Sutro was now arranging to obtain the capital, and Ralston furnished him with letters of introduction stating that the tunnel was practicable and could not fail to be very profitable. Meanwhile Sutro, anxious to protect his enterprise at every point, secured the passage of an act of Congress which defined and secured the rights and privileges of the Tunnel Company. During the fiercest of conflicts a few years later this act of Congress was all that saved the enterprise.

Thus protected, it would seem as if the Sutro Tun-

nel Company had nothing more to do except to sell stock or bonds and begin work. The mine owners had agreed to his terms; the State and the nation had given the strongest possible title to its rights, franchises, and lands. Its plans were now completed for a main tunnel of 20,489 feet from the Carson Valley to the shaft of the Savage mine. Two lateral tunnels were afterward planned, following the trend of the Comstock northerly and southerly from the Savage shaft. As finished, the total length of the main tunnel and the laterals is 33,315 feet, or about six and a third miles. There are longer and more expensive tunnels, but the reasons that make the Sutro Tunnel a remarkable achievement will appear in the further course of this narrative.

As soon as the Tunnel act passed Congress, Mr. Sutro laid the project before leading American capitalists. He finally obtained pledges to take three million dollars in stock, provided the Comstockers themselves would do something. Returning to Nevada and California, he pressed the scheme upon the mining companies with such energy that they subscribed six hundred thousand dollars, and granted him another year in which to complete negotiations for the three million dollars. Never was a project more unanimously supported by press and people, by labourers and capitalists, as the Sutro Tunnel scheme between the autumn of 1864 and the spring of 1867.

The reasons for this general support were very simple. The entire community followed the lead of the mine owners, managers, and chief speculators of the Comstock, who were supreme in politics, in social life, and in business. These owners and speculators had become persuaded of the need of a tunnel, and were inclined to become part owners in the enterprise so

as to share the expected profits in royalties and new veins to be discovered on the line of the tunnel. Besides, the mines were not paying well, most of them were in borrasca, and if that continued long it would become necessary to reduce expenses in every possible way.

Suddenly came a thunderbolt falling from cloudless skies. The Bank of California syndicate, now all-powerful on the Comstock, changed its corporate mind, cancelled the subscriptions of its various companies, and issued a decree of financial outlawry against Sutro. The tunnel, it was said, could not be constructed—at least not by Sutro, nor by his friends. He was too independent and altogether outside of the controlling forces on the lode. A telegram was sent to the Nevada senators, Nye and Stewart, at Washington, saying, “We are opposed to the Sutro Tunnel project and desire it defeated.” This was signed by William Sharon and most of the prominent mine owners, managers, and speculators. Senator Stewart instantly resigned the presidency of the Tunnel Company. Virginia City merchants and citizens began to fight the tunnel scheme. Thus Sutro’s bright prospects of obtaining a million dollars in San Francisco, besides the money promised on the Comstock, were ruined in an hour. Everywhere, with telegraphic swiftness, active, aggressive opposition was raised. When the smoke of the first tumultuous assault cleared away, all men saw that Sutro stood alone, unsupported, while against him in organized and well-equipped array were the hostile companies, the hostile Bank of California, and the hostile mining and speculating communities of California and Nevada.

It was a strange and unexpected situation. Only one man out of ten thousand would have attempted

another stroke; hardly one out of a million could have conquered his foes. Every pledge from New York capitalists was of course nullified. He had to raise between four and five million dollars for a purpose that the very persons to be benefited declared against their interests. He had to prove to investors that the Comstockers did not know their own business. He had to counteract in the newspapers, in legislatures, and in Congress itself the persistent assaults of men and associations possessing almost boundless resources—social, political, and financial.

Sutro, however, lived for but one object—to dig his “coyote hole,” as the contemptuous opposition termed it. He went to New York and again tried to obtain capital; he went to Europe and saw the princes of finance. Men of science approved of his plan, but everywhere a warning against his tunnel seemed to forerun his coming. Undismayed, he appealed again to Congress, secured the attention of the Committee on Mines and Mining, and actually had a bill reported recommending that the Government should loan five million dollars to the Tunnel Company, taking a mortgage on its property. The impeachment of Andrew Johnson, soon after, prevented this bill from coming to a vote. All this time the fight went on in newspapers and pamphlets throughout the length and breadth of the land, but chiefly on the Pacific coast. Sutro answered every thrust with a parry and return.

Said Sutro in conversation years after: “Ah! it was a hard thing to see so many old friends in Virginia City and San Francisco actually afraid to be seen talking to me after the fiat had gone forth that I was to be crushed. But I kept on fighting. There was one time, I remember, when I had to go to Washington to save my interests from destruction. I had no money

left. All the profits of my mill had been swallowed up. I had a town lot in a little California town, and I sold it for two hundred dollars. With that I managed to get to Washington. I staid there, somehow, all winter, poor as I was; I fought my enemies and I came out ahead. But they wrote to all the newspapers that I had bribed Congress—out of my two hundred dollars!”

At last, in sheer desperation, Sutro turned to the working miners of the Comstock. He hired Piper's Opera House in Virginia City and addressed them with bitter eloquence, every stroke of which went home. He denounced the unchecked avarice of the men who ruled the Bank of California and the famous Mining and Milling syndicate. What did they care for the toilers? What enterprise that tended to loosen their grip on every industry in Nevada could fail to gain their hatred? He went on to contrast, in brief, terrible sentences, the disasters from heat and fire to which the selfishness of these capitalists subjected them with the comfort and safety which the tunnel would afford. The increased profits under the tunnel system must also, he said, enable the mine owners to continue the Union scale of wages without protest for generations to come.

Sutro added immeasurably to the force of his appeal by showing to the miners, and afterward circulating among them, rude but effective campaign cartoons. One cartoon represented a rich speculator driving six fast horses and covering a working miner with contemptuous dust; another showed “Bill Sharon's big wood pile”; and still another “Bill Sharon's crooked railroad,” so as to emphasize the fact that the Bank of California syndicate controlled the transportation and owned the forests. Still other cartoons illustrated

with ferocious sarcasm many a well-known instance of careless disregard of the health and lives of the Comstock miners.

The series closed with a huge double cartoon that Milton might have conceived and Doré might have executed. A few months before there had been a fire in the Yellow Jacket mine and forty-two miners had lost their lives. It was an awful disaster; the terror of it still dwelt in the homes of the Comstock. Fire was yet smouldering in the drifts of the mines and likely to burst forth again, when Sutro sent forth his double cartoon, headed *The Yellow Jacket Fire*. On one side was a shaft a thousand feet deep full of burning and falling ladders, timbers, and machinery, a vortex of whirling smoke and flame, with hundreds of miners trying to escape and tumbling headlong into the depths; wives, mothers, and children were running to the mouth of the shaft or sinking in despair on the ground. In the other half of the picture was a similar shaft on fire, but with the Sutro Tunnel connection below, and the miners escaping to meet their wives and children.

Here are some sentences from Sutro's speech: "Will the people of Nevada see me crushed out now? Will you not see fair play when one man has the pluck to stand up against a crowd? Come in together; let three thousand labouring men pay in an average of ten dollars a month and insure the construction of the tunnel, carrying with it the control of the mines." Again: "The enemy who has spun his web around you until you are almost helpless has bribed your judges, packed your juries, hired false witnesses, bought legislatures, elected representatives to defend their iniquity, imposed taxes upon you for their private benefit, and now dares you to expose or oppose them. . . . I do not mean

to incite you to any violence, . . . but I do mean to say that you can destroy your enemy by simple concert of action. Let all of you join together to build the Sutro Tunnel; that is the way to reach them. . . . They know that the first pick struck into the tunnel will be the first pick into their graves."

Thus, with tremendous invective, Sutro carried the war into Africa and laughed to scorn the shouts of "Demagogue!" that went up from the justly alarmed capitalists. He caused such a storm that in a short time he had to use all his personal influence to prevent an outbreak. But the Miners' Union raised fifty thousand dollars by subscription and put it into Tunnel Company stock. This enabled the resolute Sutro to break ground October 19, 1869. He now had to provide means for continuing work. He had to fight his opponents in Nevada, California, Washington, New York, and Europe. It was necessary, too, that this fight should be aggressive; he must have more money. In 1870 he obtained the promise of two million dollars in France, but the Franco-Prussian War destroyed this combination. In 1871 he persuaded Congress to appoint a commission of United States engineers to examine the Comstock and the plans of the tunnel. They reported in the main unfavourably. Such a report, if sustained by the Committee on Mines and Mining, could only lead to one end—the revoking of the franchise. Sutro, as usual, rose to the occasion, and forthwith succeeded in persuading the committee that the report was biased by his opponents; the committee reversed their first decision and advocated a loan of two million dollars by the United States. This bill was finally defeated, but its very presentation in Congress was a victory for Sutro. Even his enemies began to yield unwilling admiration to his bulldog tenacity. "That little Ger-

man Jew will undermine the 'Comstock' became a saying among the capitalists.

In September, 1871, Suto won his way to the purses of some English investors and obtained \$1,450,000. This was afterward increased in America to a total of two million dollars. Immediately four hundred men were set at work in the tunnel and upon four working and ventilation shafts. Machinery was bought, shops and dwellings sprang up like mushrooms around the waste heaps, and the renewed energies of this volcanic man were concentrated upon a race against the Comstock mine owners who were fast approaching the level of the tunnel.

There was no time set by the act of Congress or any obligation of the company for the completion of the tunnel, but the general understanding was that the main line should be finished in three and a quarter years. This was based upon the calculations of the engineers, who proposed to work from four shafts as well as from the end of the tunnel, thus making nine separate stopes or headings besides some work that might be possible by drifting from the Comstock lode. But when these four shafts were begun, such torrents of water poured out of the porous rock that no machinery could be obtained to keep the two nearest the lode clear enough to work in; the other two, though finally sunk to the tunnel level, were often rendered useless from the same cause. Hand drills were used at first, and the rate of progress was slow; it would have required seven or eight years for the completion of the main tunnel. Besides, the increase of heat was extraordinary, and the atmosphere grew so bad at the face of the heading that competent authorities have doubted whether the tunnel would ever have been completed if the costly and complicated power drills just beginning to come

into use at Mount Ceniz and elsewhere had not been greatly improved by American inventors. Burleigh and Ingersoll drills soon changed the aspect of affairs. An interesting comparison made at this time between a famous Freiburg tunnel, the Rothschoenberger Stollen, and the Sutro, is as follows: The German tunnel was advancing by handwork in gneiss rock from a single heading about twenty-six feet a month; the Nevada tunnel was advancing in andesite from a single heading one hundred and five feet a month. When power drills were introduced the advance of the German work increased to eighty-four feet, while that of the Nevada enterprise rose to three hundred and ten feet. The monthly advance of the Sutro Tunnel during 1875 and 1876 maintained an average of three hundred and eight feet, an unequalled record that attracted the attention of mining engineers, who declared that Sutro's "coyote hole" was the greatest undertaking in America.

Meanwhile the working miners of the Comstock were fighting their old enemies—water, heat, and lack of ventilation—and hoping for the completion of the tunnel. Mining superintendents, who still claimed that they needed no help from Sutro, were forced to acknowledge that the water plague was almost more than they could endure. "To chronicle such a contest," wrote one observer, "is to write down an unvaried record of flooded shafts and levels, of temporary drainage and new inbursts of water, or, more discouraging still, of broken pumps and of delusive gains, when the battle was really a drawn one and the pumps could only hold the rising water in check." The cost of pumping on the Ophir was seventy-two thousand dollars a year.

So matters progressed through the days of the

Crown Point bonanza and the early days of the greater marvels of Consolidated Virginia and California—the mine owners steadily declaring that they would never use the tunnel; Sutro and his men hammering on beneath the mountain. Never were men and machinery handled with greater skill; picked miners in short shifts drove the advancing drills every moment of day and night and every day in the week; skilled timbermen propped the tunnel; young athletes threw fragments of hot rock into iron tram cars; long trains of mules and cars went to and fro under swinging lanterns. “Faster! Faster!” cried Sutro to his willing workers; “every ton of ore taken from the bonanza loses our company two dollars!”

In 1873 the temperature at the face of the tunnel was only 72° Fahr. It rose to 83° the next year, to 90° in 1876, to 96° in January, 1878, and to 109° in April. This was in spite of the most powerful blowers to be obtained which were used to force fresh air into the tunnel. The heading was nearing the Comstock lode and its solfataric springs. The lamps burned dimly; workmen at the front fainted at their posts. Another danger threatened them. Portions of the tunnel crumbled and fell, crushing the supports in places, and only constant vigilance and labour prevented a catastrophe which might have crushed the air pipes and killed every man at the heading. The workmen were two miles from the nearest ventilation shaft when this terrific heat was encountered, and it grew worse till the face of the rock showed a temperature of 114°. After May, 1878, two or three hours of work were all that the strongest and most experienced miners could endure. The mules often refused to enter the tunnel, and they were dragged by main strength from the air-escapes. It was evident that en-

duration was being strained to its utmost capacity. Man after man dropped down on the rocky floor and was carried to the surface, babbling and incoherent, to slowly recover from the poisonous air.

At last the miners in the Savage heard the blasts of Sutro's approaching tunnel, and then the blows of the power drills. On July 8, 1878, Sutro himself, half naked, like one of his miners, toiled at the front, and toward night, when the final blast tore a jagged hole through the wall of rock, he crawled through the opening, "overcome with excitement," as one of the newspapers said. The rush of hot air and smoke from the tunnel was almost unbearable to the men working in the cooler Savage drifts; clouds of dust, fine rock, and impurities, gathered in the tunnel during the nearly nine years that had passed since its commencement, shot upward through the shaft of the Savage.

The immediate goal was now attained, but a firm treaty of peace between the contending parties was essential. Most of the mine owners still said that they did not need the tunnel, and refused to stand by their contracts. A crisis came in 1879 when the Hale and Norcross pump broke and water began to flood several mines. The superintendents immediately turned the flow from the remaining pumps into the tunnel, driving out the workmen. Sutro began to put in a water-tight bulkhead. Either open war or a lawsuit carried eventually into the Supreme Court appeared the only alternatives.

Fortunately for all concerned, wiser counsels prevailed, and new agreements, which bound every company on the lode, were entered into. A thousand workmen began to cut a drain channel five feet wide down the middle of the tunnel floor, and by July it was in full use. The temperature of the water, even at the

mouth of the tunnel, was never below 100° Fahr., and it often entered the tunnel at 130° and even 160°. The amount of flow in 1880 was not less than 1,300,000,000 gallons, and as other mines began to use the tunnel, the total annual drainage rose at times to nearly or quite two billion gallons. When work is again attempted on the lowest levels of the Comstock, for years left idle, the value of the Sutro Tunnel will be even more evident.

At the time of the completion of the tunnel the leading mines were using more powerful pumping machinery than had ever been applied to such purposes. Perhaps the power required in these engines is best shown by the size of the wooden pump-rods. Formerly made 12 by 12 inches, they were now made 14 by 16 inches, of sections of the best selected Oregon pine strapped together by iron plates, yet breakages were frequent. The Belcher pump-rod broke twelve times in eight months. It is estimated that the cost of handling the water in 1880 was three million dollars, even with the aid of the tunnel.

When his victory was complete, Sutro retired from the control of the tunnel, selling his stock at a high price and removing to San Francisco, and became one of the foremost citizens of California. He knew Nevada and the Comstock better than most men of his time, for he had been a part of the whole dramatic and eventful story ever since 1860. After twenty years devoted with singular courage and ability to a single purpose, that purpose had rounded into well-wrought achievement, and when he left the Comstock he was one of the most widely known men in America.

Even after Sutro left the Comstock his memorable "coyote hole" continued to share the fortunes, good or ill, of the great lode it drained. According to the

report of Mr. Theodore Sutro, in 1887 the main tunnel had cost in round figures \$3,500,000, and the laterals had brought this sum up to \$5,000,000. What was considered in 1879 one of the larger possibilities of the tunnel has never been developed. Its friends constantly spoke of the "facilities which the tunnel afforded for the extracting and smelting of millions of tons of low-grade ore" which lay partly exposed to view in the two hundred miles of shafts and galleries, and partly still concealed in the depths of the Comstock mines. This ore was passed by in those days, though worth ten or twelve dollars a ton, because by the methods employed—the mills, the railroad, the hoisting works—it could not be worked at a profit. The Sutro Tunnel Company still claims that by water-power mills on the Carson this low-grade ore can be worked at six or eight dollars a ton, thus building up a new industry without injuring the towns on the Comstock. Unfortunately, the plan has never received a full and fair test. Though the tunnel company is said to have a great deal of low-grade ore in its own territory, lack of means has prevented thorough exploration of its resources, as well as the building of reduction works. The tunnel, like the great lode, has long been in borrasca.

CHAPTER XVIII.

OUTSIDE VIEW OF A MINE.

ALL this time, while describing pioneer life, early settlement, the bonanzas, the Sutro Tunnel, and many other episodes of the long story of the Comstock, one has necessarily made passing allusions to the buildings and machinery on the surface of the ground, and to the still more interesting details of the inside workings of the great mines on the lode. So much remains to be told, however, respecting the appearance of a mine of the first rank, "on deck" and "between decks," that this chapter and that which follows are devoted to mines and mine equipment as they appear at times of especial activity and high organization.

When a visitor goes to the Comstock he sees the ruins of many old mine buildings no longer in use, because much larger and more complete structures over the later shafts have taken their place. Of the more important large shafts there were twenty-four in 1880, several of them huge combination shafts used by more than one mine. The surface of the lode is so irregular that the altitudes of the tops of the shafts vary to an extent that would be surprising anywhere except in such a wild mountain region; the highest shaft, Bullion, begins 6,307 feet above the sea, and the lowest, the old Overman, begins 5,731 feet above the sea, showing a difference of 536 feet on the lode—enough to make quite a hill on a Western prairie. The surface

workings of the Comstock are on the side of a mountain furrowed by immense ravines, where men have, with marvellous persistence and energy, hewn out or built up, on terraces supported by masonry, sufficient room for mine and mill buildings.

Any one of the great mines when in active operation will serve as a type of the general plan of outside works, the result of thirty years of experience under Comstock conditions. Nothing better can be found in the way of concrete illustration than the works grouped about California and Consolidated Virginia with the old shafts, the new combination shafts, the mills, yards, railroad tracks, trestle works, machinery, and all that so well represents the modern industry of mining. What one sees at the main works is a very large mass of high buildings, partly on the level, partly terraced down the slope, and still further complicated by wings, annexes, and various additions—all thoroughly well made and painted with fire-proof paint. Surrounding the whole and between the wings and additions are piles of iron, lumber, cord wood, separate buildings, and vast collections of supplies of every imaginable sort.

The main mass of buildings resembles nothing so much as the union of several large foundries and manufacturing factories. A row of tall smokestacks steadied by steel cables mark the location of the engines, the blacksmith shops, and the machine shops. As one goes around the yards and the vast structures full of life and activity, the passing impression varies; here are flat steel cables woven or twisted, copper wire, steel bars, and hardware in a thousand forms; yonder are supplies enough, one would think, to stock a street full of wholesale houses. There is a powder house; there are offices for clerks and superintendents and a build-

ing where bullion is melted and assaying is done; there are also rooms for the surveyors, draughtsmen, and civil engineers. But there is no mine in sight anywhere.

Some idea of the variety of articles that come under the general head of supplies and are gathered together in the storehouses here may be obtained from a few notes of purchases made by a single mine (California) in 1877, when over \$315,000 was spent for miscellaneous supplies and over \$547,000 for fuel and for the timbers and iron used in the new shaft then being sunk. The "regular supplies" stored up and used above ground or sent down into the mines as required included the following large items: Timber, over 10,000,000 feet, costing about \$224,000; ice, nearly 2,000,000 pounds, costing about \$22,000; powder to the value of \$17,000; candles worth \$16,000; steel and iron, \$5,000.

If we take the total expense account of the same mine for that year (1877), we obtain, perhaps, a more striking impression of the scale of operations. Supplies, as we have seen, were used to the value of about \$315,000; salaries and wages came to about \$788,000; cost of reduction was \$2,220,000; of hoisting, \$186,000; and of assaying, \$53,000. Office expenses, teaming, surveying, taxes, litigation, and miscellaneous items, added to the above, bring the total to considerably more than \$4,000,000. In such a mine the value of the outside works is nearly impossible to determine, for it is constantly changing. If there is no mill attached, half a million dollars would be a low estimate; complete reduction works add as much more to the total.

Everywhere, in the first view of a mine, lumber, firewood, and machinery are the most striking features.

The depths of the mine in the last thirty years have swallowed up fully 800,000,000 feet of timber—enough, if sawed into boards and scantlings, to construct forty thousand two-story houses of six rooms each. These would provide homes for two hundred thousand people. If the consumption of lumber had always been at the rate of such bonanza years as 1875 and 1876, the Comstock lode would now contain nearly three times as much lumber as this buried in its shafts and drifts, or sufficient for the homes of six hundred thousand people. Hundreds of square miles of forest have been cut to supply this inexorable demand, and every foot of timber used has been hauled to Gold Hill or Virginia City and piled in the lumber yards at the works.

The fuel used during the past thirty years has aggregated something like three million cords. It consists for the most part of yellow pine, pitch pine, tamarack, and fir, and vast tiers of it lie piled up at all seasons. In 1880 the Sierra Nevada furnaces used about sixteen thousand cords of wood, and four other mines used more than ten thousand cords apiece. Such a mine keeps six months' supply of fuel on hand, and even a smaller mine always has five hundred cords piled in the yard.

The machinery is of so many different types and is constantly undergoing so many changes, repairs, and improvements, that the foundries and machine shops at the mouth of a mine often seem as if they had been transplanted bodily to the Comstock from some large seaport. The immense power of the pumping engines has been noticed, but the total horse power represented by all the engines used on the Comstock affords a still better measure of the work done. The mines in 1880 had engines of a combined capacity of 21,000

horse power. Single mines have had 2,000, and even 3,000 horse power in use at times.

Outside of each of the vast structures is a pile of waste rock, the dump of the hidden mine. This is perhaps the most peculiar feature of the place, and if the mine that supplies it is of the first rank, the size of the pile is mountainous. A part of the waste rock sometimes goes to make acres of level ground on which to place the mine buildings and the quartz mill, but there is so much left to be poured down into the cañons that the sum total is really one of the most impressive things about Virginia City. Cars run out upon a track extending from the building far over the middle of the dump, and are emptied automatically. They flash back and forth all day, all night, every day in the week, and the waste rock and *débris* slide slowly to the bottom of the great dusty pyramid, on which no green leaf ever grows. Such a pile, much smaller, and of sawdust instead of broken rock, the lumber mills make along the Mendocino coast; but always these latter smoke and blacken with an ever-smouldering fire that burns unquenched for decades, and always the wild flowers of the forest grow in the very edges of the fragrant hills of sawdust. In strange contrast, the waste rock mountains of the Comstock are without life, colour, sound, or change, except the rattle of bits of porphyry and the sharp sunlight gleaming on whitening clays and splinters of stone piled on barren hollows above the sage brush.

The central building over the mouth of the large shaft sunk in partnership by the California and Consolidated Virginia mines, is high, steep-roofed and large, heavily framed, floored solidly and well, open to the roof forty and fifty feet above, and in every respect suited to the requirements. Men—dozens of

them—quiet, busy men dressed in woollen shirts, small felt hats or caps, and blue overalls, are directing and operating affairs. Those whose duties do not take them down into the mines are in ordinary citizen's clothes. From the middle of the floor, through a row of four square openings, white columns of steam often rush upward in huge volumes rolling to the roof; it is the breath of the mines below, and in cold weather the warm lower levels send up these whirling clouds. The four openings are the tops of the four compartments of the shaft, which is not only lined on every side with square timbers, but is still further divided by perpendicular partitions. The timbering leaves these lesser parallel shafts about five feet square, and one is occupied by the pipes of the pumping machinery, while the other three are hoisting compartments.

This is the top of the mine; through these small shafts the business of the mine is carried on. The cages that move up and down may be compared to hotel elevators, only in this case the hotel is from fifteen hundred to three thousand feet high and pushed down into the ground so that everything except the roof is out of sight. The elevators begin at the roof and go down to the basement, past floor after floor, station after station, passageway after passageway, until the place is reached where another cellar is being hewed out.

Some sixty feet from the steaming shaft top is a large, square platform raised several feet above the floor. Here, on frames of massive timbers built upon solid rock and filled in with cement, are the hoisting engines; here the engineers sit under a placard something like this: "No person allowed on the platform, or to speak to the engineers." There is reason enough for the warning, for the lives of many men are in the

hands of the engineer and his assistants. These mine engineers are strong, modest, manly—much such men as are in similar places of responsibility in the engine rooms of a Cunarder.

Before the face of each engineer is a large “indicator” like a clock, or sometimes in the form of a cylinder, which shows exactly where the cage is; beside it is the bell by which he communicates with the officers and workmen on the different levels of the mine. He stops and starts the cage, “slows up,” goes ahead at full speed, receives word about the contents of the cage, and many other important matters. Safety cages are now used, similar in construction to the elevators in large buildings but much heavier, and one source of accident is thus removed. The mouth of each compartment that opens through the floor of the main building is closely covered with an iron grating which each cage lifts as it comes up, and the place is sometimes still further protected by a railing, so that few accidents occur at the top of a mine except through careless engineers.

The power of the hoisting engine is necessarily great. At the Yellow Jacket the two hoisting engines are each of 1,000 horse power. The main engine at the California and Consolidated Virginia shaft, everywhere known as the “C. & C.,” is of 2,000 horse power; it lifts a cage with two cars of rock and handles a passenger cage at the same time. What would be called an average cable at one of these great mines is made of steel wire, woven flat, seven inches wide and five eighths of an inch thick; the pulleys are forty or fifty feet above the shaft mouth on a cross-beam supported by a very large and massive frame which is built around the mouth of the shaft and is called the “gallows-frame.”

There are two kinds of cable reels. In some cases

the cable is coiled directly upon a short reel; in other cases a drum is used. The latter is known as the tapering hoisting reel, which is a drum of very heavy wood turning with a wrought-iron shaft sixteen inches in diameter. On this base beam after beam has been bolted until the result is a structure fifteen feet long, thirteen feet in diameter at one end and twenty-two feet at the other. On the outside of the truncated cone thus obtained iron plates are bolted, and a deep spiral groove is made from end to end in the iron to guide and steady the cable as it winds and unwinds. The wrought-iron shaft turns in a framework that reaches quite through the floor of the building, and is sunk deep in solid rock and braced against every strain.

A steel cable such as is used on the Comstock weighs from twenty-five thousand to forty thousand pounds. In the case of those that taper regularly toward the lower end, where less strength is needed, the reduced size is not obtained by leaving out some wires, but by gradually tapering each wire in its manufacture. The flat cables are much preferred for heavier work, and were first made by Mr. A. S. Hallidie, of San Francisco, the inventor of the cable system of street cars so much in use in that city.

The engineers of the Comstock greatly increased the efficiency of their steam engines, so as to save fuel. The valve gear on compound engines was greatly changed. The hoisting engines were made to act directly upon the cables by keying the reel to the main shaft, increasing the possible speed with which the cables could be hoisted to three thousand feet per minute, a rate ten times greater than the utmost speed attainable before 1865.

Danger seems inseparable from such machinery. If an engineer loses his presence of mind for a second

while guiding the swift-flying cage, the men may be hurled to destruction. At the Union shaft, in 1879, the engineer, a careful and temperate man, was hoisting a cage with seventeen men from the bottom of the shaft; when they were near the top he started to shut off steam, but turned the lever the wrong way and the cage shot swiftly into sight. Losing his head entirely, the poor engineer threw the valve still farther over, and the cage, leaping upward, gleaming and terrible, struck the timbers of the gallows frame and snapped the seven-inch cable, which "parted like twine," making a report like the sound of a cannon. The cable flew backward and swung on one side, mowing down timbers and machinery as far as it could reach. It was like that most tremendous accident known on ship-board, the breaking loose of a gun amidships. The great building shook to the granite foundations, and men cried out that one of the boilers had exploded. When the cage struck, every man except two who clung to the shattered frame, and one who seized the bell rope, were hurled against the roof and fell dead, dying, or crippled on the floor.

One must not expect to see a close-walled box or steel cage for an elevator. The miners have only a heavy iron cage, entirely open on two sides and nearly so on the others. Some cages are single; some have two floors and are called double-deckers. The old-style three- and four-deckers have now gone out of use. Loaded iron cars come out of the depths and are at once hooked to a cable that pulls them from the cage along a track on the floor of the building, or they are rolled out by men in waiting. If the contents are worthless, the cars are quickly switched to the dumps and so disappear; if they consist of ore for the mill, they go to one of the most important and complicated of all the

huge structures that cluster around the mouth of a Comstock mine.

The Consolidated Virginia mill as built in bonanza days has sixty stamps of eight hundred pounds each, forty pans, four agitators, and twenty settlers, and is capable of reducing two hundred and fifty tons of ore daily. The California mill has eighty stamps of nine hundred and eighty-four pounds each, forty-six pans, four agitators, and twenty settlers, and can work three hundred and eighty tons daily. The sixty-stamp Consolidated Virginia mill is a good type of the more modern improved work of the Comstock. Let us follow the course of an ore car from the mouth of the shaft and see what happens to it.

This mill is built near the rest of the main structure on a lower level. A car track nearly three hundred feet long leads straight from the mouth of the shaft in the main building to the roof of the quartz mill. It is supported forty-five feet in the air on trestlework, and is boarded over its whole length with rows of windows on each side, so that it "resembles nothing else so much as a ropewalk." The ore cars are made up into little trains and hauled to the top of the mill by mules. One of the famous mules in bonanza days was known far and wide as "Mary Ann Simpson." Tradition had it that she knew more about mill work than any man employed in the mine, and she had certainly hauled millions of dollars from shaft mouth to mill. In some mines the ore is carried by an endless belt in buckets on a cable, or the cars are drawn by a cable run by a shaft from an engine.

When dumped, the ore falls into chutes in the roof of the mill, and what the Californian hydraulic miners first named "grizzlies" are set in the bottom of each chute. A grizzly is a screen of parallel iron bars three

inches apart, in most cases, set sloping, and loose at one end, so that while the finer rock goes through, all larger fragments roll into the jaws of a rock breaker, whence, after having been sufficiently crushed, the material goes through another chute into the main ore bins to which the smaller rocks went at once. In the hydraulic mines, where sets of grizzlies are sometimes used to keep boulders out of the flumes, the mingled roar of the foaming waters, the harsh crashing of rolling rocks, and the clang of quivering bars of massive iron can be heard a long distance. It is one of the noisiest things about such a mine, but its name does not seem very appropriately taken from the monarch of the Sierran wilderness, whose tread, though lumbering, is noiseless, and whose loudest utterance is a menacing growl.

Returning to our typical mill on the Comstock, the ore bin where the crushed rock falls is one hundred and ten feet long and the contents are fed by chutes to the eight batteries of ten stamps each. The mill building stands upon ground that was terraced in the most careful manner, so that the different parts of the structure stands upon different levels, as is required for the most perfect economy of labour and time. After the ore is once delivered at the top of the building, gravity is made to do as much work as possible.

Beginning with the power required to run a mill of this type, it is primarily a 600-horse-power compound condensing engine. There are two cylinders, one of twenty-four by forty-eight inches and the other forty-eight by forty-eight inches; steam which goes into the initial or smaller cylinder, cut off at the half stroke, goes into the expansion cylinder, where it fills eight times the bulk it first had. Instead of going into the air, it then exhausts into a condenser which is so

arranged as to counterbalance the atmospheric pressure at the altitude of Virginia City. In ways like this the ponderous machinery of the Comstock is all adapted by a host of details to suit exactly the work and the locality. The main shaft of the engine is fourteen inches in diameter, weighing fifteen thousand pounds. The fly wheel, eighteen feet across, weighs thirty-three thousand pounds. A belt from the fly wheel, which is also a band wheel, drives the stamps in the batteries. A long shaft eleven inches in diameter goes into the amalgamating room and drives the machinery of the pans and settlers. The engine itself weighs fifty tons and rests on solid masonry. There are eight boilers, each sixteen feet long and fifty-four inches in diameter, and four huge smokestacks, each ninety feet high, extending forty feet above the roof.

The progress of the ore from the ore bin, under the stamps, through the amalgamating room, to the retort house, and finally to the melting room, where the refined metal is cast into bars of bullion, would require many chapters full of technical details which properly belong to metallurgical treatises. It may be noted in passing that there is a great deal of gold in all the Comstock ore, but the quantity varies in different mines and at different levels. In the whole lode the average amount of gold is about forty-two per cent, but the Gold Hill group contains forty-seven per cent of gold in its total yield to date, and in some single mines the gold has been nearly sixty per cent.

The forty-six mining companies of the Comstock in 1866 had forty-four engines, of a total horse power of 1,500, used for pumping and hoisting, and sixty-two mills run by steam and water power, with 1,271 stamps crushing 57,112 tons of ore each month. Fifteen years later (in 1881) the total horse power of all

the engines on the lode was nearly 21,000, and it has not materially increased since that time. When all the energies of the men of the Comstock are again directed to going deeper there will have to be another great advance in the machinery used, and the inventive skill of the world will be taxed to its utmost. If new and greater bonanzas are found, the mills themselves will be reconstructed upon a larger scale.

We leave the deafening clang and clatter of the mills and turn back to the main building. We have seen the progress of the ore from the top of the shaft to the retorts and the assay office. It is time to descend into the mine itself, where the iron ore cars are being filled and pushed along underground rails to the station. It is time to study life in the chain of subterranean cities of the Comstock.

CHAPTER XIX.

THE CITY UNDERGROUND.

AT last we are ready to study at its best the great subterranean city, the chain of works for whose maintenance and extension, mills, machinery, and towns on the surface were created. We are ready to go down the main shaft, stop at a "station," explore a drift, see the miners at work, and hear stories of peril and adventure.

The visitor retires to a dressing room, takes off his or her ordinary clothing, puts on one of the suits kept there for the purpose—flannel pantaloons, woollen shirt, heavy shoes, and felt hat—is placed in charge of a foreman, and they enter the cage. The foreman waves his hand; in an instant we are dropping noiselessly into the darkness, lit only by the flickering rays of a lantern which shows timbers seemingly leaping upward.

Pretty soon a station appears, but we pass without pausing. There seems to be a large irregular room opening back from the side of the shaft. Men are busy there, moving about in the well-lighted space, and there is machinery at work. If we went slower we should see a drift extending from the station and dividing into many other passages, and miners and foreman would be noticed passing to and fro engaged in various occupations. Every hundred feet a station

flashes past, and the immensity of the work begins to grow upon the traveller.

Sometimes the man in charge of a station hails us as we pass, and the foreman makes a reply that is Choctaw to the uninitiated, for we are dropping rapidly away from the sound. As we reach a depth of a thousand feet or so the cable sometimes begins to "spring" with a peculiarly disagreeable bobbing motion, which gives a novice a new sensation, as if hung in an abyss by a rubber strap. In the midst of this we come to a full stop at the fifteen-hundred-foot station and step off on the floor.

A station is the office for the work done on that mining level, as well as the point where men stop and where freight is shipped or received. It is walled, roofed, and floored with huge timbers and planks, and is a large, well-lighted place crowded with mining supplies, barrels of ice water, candles, fuse, powder, tools, etc. If it were not for a car track which crosses the middle of the floor, coming from the level beyond and connecting by switches with all the hoisting compartments of the shaft, the place would sometimes seem a combination of office and country store. The car track that extends through the main drift of the mine connects by turntables with the side drifts and cross-cuts. Laden cars arrive regularly from the "stopes" or places where ore is being taken out, and are sent to the surface by the station tender. Empty cars as they arrive are returned to some place where they are needed by the car men, and so the work goes on steadily, excepting when shifts are changed.

The drifts, or "galleries" as some call them, are from four to six feet wide and seven to eight feet high. The miners prefer to cut them outside of the vein as much as possible, as there is less danger of caves. The

floor of a drift is horizontal, or slightly raised, to facilitate the delivery of ore. The main north and south drift is the Broadway of the level, and sometimes even contains a double car track. The cross-cuts start from the main drift at right angles with the vein, so as to cut into the ore body if any is found. Like the levels, they are about a hundred feet apart. They are extended entirely across the lode to the other wall, and are connected with each other by cross-drifts. Every new cross-cut attracts the attention of all who are interested in the mine. If one cross-cut is in pay ore there is much greater excitement when the next one, a hundred feet farther on, is to be opened. In this way, with drifts, cross-cuts, and cross-drifts, the skeleton of the underground plan begins to be apparent. Imagine a general plan something like this on each level, and we only have to describe the winzes to complete the framework of the passageways. A winze is a small shaft sunk wherever it is needed, from one level to another, for ventilation, to explore new ground, or often, when sloping, to serve as a chute for ore and timbers. An "upraise" is the beginning of a winze started on a level and carried upward toward the next higher level. If it is finished its name is changed to winze. The only connection between one level and another besides the main shaft is by means of these winzes. Vertical winzes are in reality shafts; sloping winzes are inclines; drifts, cross-cuts, and cross-drifts are really tunnels.

The main shaft which connects all these underground workings is not always vertical, neither does it always remain the same for its entire length; it may be an "incline," as the Crown Point shaft, which is vertical to the eleven-hundred-foot level and then follows the lode, which dips thirty-five degrees at that

point. The car used for hoisting through an incline is a "giraffe," absurdly called so "because the hind wheels are very large and the front ones low, so as to keep the car level." One would suppose that the name kangaroo would be more appropriate. It carries eight tons of ore at a trip. Sometimes another or "back-action" car is fastened behind. A ride on a giraffe is very exciting. The track is well lighted and the cars climb it with the speed of a lightning express. The giraffes, like the elevator cages, have safety grips. At the bottom of the shaft or incline is the "sump," a pit or well sunk there to collect the water from the mine. Here are the suction ends of the pumps.

To have a main shaft presupposes that there are some air shafts for ventilation; but there are few on the Comstock, ventilation being secured as far as possible by connection with the main shafts of other mines. The miners agree that the draught of a mine remains permanent for years, but if a fire in a mine changes the draught, it never changes back. A "down-cast" has thus been changed in an hour to an "up-cast." The general tendency of air currents in the Comstock is in the same direction as the slope of the ore chimneys—that is, southward. Each new connection makes changes in the air currents in all the mines.

There is machinery in the mines, and often a great deal of it. Steam makes too much heat, but compressed air, hydraulic power, and electricity are now used with entire success. Small engines run the "blowers" to force fresh air through pipes to every part of the mine, but particularly to the heads of the new cuts, drifts, and upraises; others hoist and lower rock and other materials in the various winzes, and still others drive the drills. All this makes a network of

pipes, mostly for compressed air, extending throughout the mine.

The admirable system which prevails is nowhere more manifest than in the way men are handled. They form in line in the hoisting works and march into the cages. They leave the mines in the same way. Three shifts of eight hours each make the day of twenty-four hours. "Morning shift" is from 7 A. M. to 3 P. M.; "afternoon shift" from 3 to 11 P. M., and "night shift" till 7 again. Each level of the mine has therefore its three shift bosses. The clerk who acts as time-keeper has an office in the hoisting works and registers every man's ingoing and outcoming with the regularity of a machine. The shift bosses report men missing or sick, also accidents, or anything else of importance. They tally loads of ore and waste rock, filling up a printed blank. The superintendent thus knows how much work each shift has accomplished. Each level has a foreman. The mine has also a general underground foreman, and an assistant to take his place at night. As regards the workmen, there is complete classification. The timber men attend to the supports of the various workings; the miners, drill men, and drifters hew and cut passages and extract the ore; the pump men and engineers see to their respective duties. Watchmen make regular rounds, messengers carry orders, take the men water or tools, and gather up the dulled picks and crowbars to send them to the forges.

Lamps, candles, and electric lights gleam along the rocky aisles of the mines, except in long unused portions. Since one mine is connected with another on the various levels, the boundary lines being accurately marked on the walls of the main drifts, the longer streets of the underground city extend for three and four miles, and in active times men are met at almost

every corner and turn, singly or in groups. It is a busy, populous city, and its inhabitants are a superb race of men, white-skinned twilight dwellers, naked except for shoes, overalls, and small felt caps. They go about quietly with hardly a word to each other. It is a land of silence as well as of candlelight. One begins to understand why miners have always made such unconquerable soldiers at times of national need; these men are soldiers already in their power to yield prompt obedience and in their capacity to move together in solid phalanxes.

On the Comstock the arch enemy is heat. "View their work!" says Mr. Lord in his history of the lode. "They enter narrow galleries where the air is scarce respirable. By the dim light of their lanterns a dingy rock surface braced by rotting props is visible. The stench of decaying vegetable matter, hot, foul water, and human excretions intensify the effects of the heat." The men can not wear woollen garments, they perspire so freely. In the most heated parts of the mine they work ten or fifteen minutes, then run to thrust their heads under cooler water from the pipes, and to breathe deeply the fresh air forced out of the blowing tubes. They soon become so exhausted that the shift boss orders them back to lighter work in less torrid drifts. Miles of passageways have been cut in air so unendurable that candles burned blue and went out, and men falling down were dragged back by their comrades.

About 1868 it began to be noticed that the points of greatest heat in the lode moved considerably from year to year, as if the hot-water streams sometimes filled one part of the lode and sometimes another. Crown Point, on the fourteen-hundred-foot level, struck a stream so hot that eggs were readily cooked in it, but a year later the heat at this place was much lessened.

Bullion on the seventeen-hundred-foot level registered 140° Fahr. About this time an enormous vein of hot water was tapped at various points along the lode. It has been estimated that the water pumped out of the Comstock at this period and the air in circulation through the mines were together removing annually an amount of caloric that was the full equivalent of that produced by fifty-six thousand tons of the best anthracite coal, burned in the most economical manner. Notwithstanding this constant extraction of heat from the lode, the temperature continued to increase, though with many fluctuations, as greater depths were attained in the various mines.

Specialists have had a pretty quarrel over the cause of the heat in the lode. Prof. Church says: "Chemical combinations between the water and the lode rocks"—technically, kaolinization of the lode feldspar. Others say that the water in the lode rises from "where the eruptive rocks retain much of their primal heat." The highest recorded water temperature here is 175° Fahr., and large areas of rock remain at from 130° to 150°. When the miners were working on the lowest levels of the deepest shafts, three thousand feet and more from the surface, there was every sign of entering a new hot belt probably far greater than any heat previously known in the entire history of mining. By the compressed-air pipes the five or six men at a heading receive fully seven hundred cubic inches of air per minute. It reaches the place at a temperature of about 90°, seldom less. On some levels each miner drinks three or four gallons of ice water in his eight-hour shift. The hotter parts of Consolidated Virginia have required ninety-five pounds of ice daily to every miner at work. "Even with this help," said the Territorial Enterprise, "four picked men in some stopes

have found themselves unable to do the work of one man in a cool drift." An incline in Savage became so tropical as it advanced that the men who were arranging the pump rod at a new station staggered out half dead with cholera-like cramps caused by the blinding heat and foul air. Men lost their wits, raved, sang, talked like lunatics, and had to be taken to a less heated part of the level, where they were rubbed and kneaded from head to foot, especially on the stomach. Sometimes it was necessary to carry them to the surface and obtain prompt medical attendance. Under these searching strains, which tried the best constitutions until the weakest place gave way, men often perished in the drifts. Besides those who yielded to heart failure, apoplexy, and suffocation, some were tortured to death by falling into pools of boiling water.

Besides this intense heat of the lower levels, the hot water met with in running drifts and crosscuts is sometimes so poisonous with the minerals it contains in solution that when a vein is tapped it blinds every miner in that part of the workings. Their faces swell and their eyes remain closed until they have been some time in the open air and under medical treatment. Then, too, the old shafts in the upper levels, long ago abandoned and marked "dangerous" on the mine maps, have been left to darkness and decay. Acres of underground passages and ore chambers here are ghastly, crumbling ruins, trembling under the step of every explorer. Timbers are twisted and crushed to half their original length or pressed together by the weight of the mountains overhead until they seem like flattened, broken, entangled straws in the "lake" of a cider press. Occasionally some one creeps along the remaining crevices into the shapeless and fast-closing chambers of ancient bonanzas. The foul and

musty odours of a charnel house fill the hot, dripping, desolate darkness; moist and slimy fungi of gigantic size and strange shapes grow out of the walls and timbers; fire damp fills many of the drifts, and dangerous explosions occur; phosphorescent lights glow at times in these tangled tropical forests overthrown and crushed together, and in winter nights abandoned shafts are sometimes illuminated with dazzling blue flames that might serve for the witch scene of an opera.

The ordinary accidents which are everywhere inseparable from mining life occur on the Comstock in every possible form, only on a larger scale than usual. The character of the vein matter would be termed "extra hazardous" by every mining man. Three hundred fatal accidents and six hundred "severe injuries" were reported in the files of the Virginia City newspapers between 1863 and 1880. It is safe to estimate that from the time the mines were opened in 1859 to the summer of 1893—thirty-four years—there have been six hundred fatal and twelve hundred severe accidents on the Comstock. The years for which the statistics are most complete show inexplicable variation. Accidents seem to go by groups and seasons, and there are many superstitions respecting the subject among miners themselves.

Although not the greatest source of mining disaster, according to statistics, a fire is by far the most dreaded of all accidents. In some mines there is but a single shaft up which to escape, and smoke and explosive gases add to the dangers. There may be eight or nine hundred men compelled to take their turns to ascend the shaft in the cages; the gas explosions put out most of the lights, and men rushing to escape fall headlong into winzes and chutes. Other accidents only endanger a few men nearest the scene, but when

the timbers take fire every person in the mine is in imminent danger. The slightest smell of anything burning is instantly noticed and examined into. A man could cause an excitement throughout half a dozen levels of a mine by lighting a newspaper in a candle, for the smoke would soon penetrate the drifts, and anxious miners would begin to tumble out of every nook and cranny.

The amount of lumber packed into a mine is so great and the draught in case of fire is so violent that hurricanes of flames and smoke leap through the narrow channels of rock and beat in resistless waves to the remotest opening. It can hardly be possible to overestimate the inflammability of a well-timbered Comstock mine. Where bonanzas once existed are oval chambers, one or two thousand feet high, packed full of cribs of timbers, with hundreds of floors of two- and three-inch planks on which the miners stood to work away at the roof as they rose on frame after frame from the bottom to the top of the bonanza. There are stairs, timber-lined chutes, winzes, drifts, and cross-cuts, and everywhere, besides the heavy timbers, there are miles of "lagging" behind the frames. Things could not be better arranged for a conflagration.

Some glimpses of the famous fire in Yellow Jacket will serve to illustrate the subject. Here the fire began about seven o'clock one April morning in 1869 on the eight-hundred-foot level, two hundred feet from the main shaft. The morning shift was in the mine when the alarm was given, and Gold Hill and Virginia City were aroused. At the shafts of Kentuck and Crown Point, the adjacent mines, as well as in the Yellow Jacket shaft, blinding volumes of smoke prevented descent. As when a ship is in the breakers grinding to pieces against sharp rocks, those on board are some-

times as completely beyond mortal help as if they were upon another planet, so in this case the firemen and miners found it impossible to descend, not only on account of the black, thick smoke, but because of the highly mineralized and deadly gases which made men faint and dizzy yards from the mouths of the shafts.

A safety lantern was put on a cage and sent down with a message of cheer written in large letters on a piece of pasteboard: "We shall get you out soon. It is death to attempt to come up from where you are. Write a word to us." The cage descended slowly, stopping long at level after level to the lowest point at which any of the men were; it came back without any reply. A draught suddenly drew the smoke out of the Kentucky shaft, and men were able to descend in the cages; they found the bodies of two miners; the gathering of Death's harvest had begun. Crown Point could not be entered, but the smoke and gas drew away from Yellow Jacket after an hour or two, and men began to bring up the dead in that shaft, carrying them through a circle of rope extended about the hoisting works and laying them on the ground.

Firemen took hose, and carried it down the shaft to the eight-hundred-foot level; miners and timber men went with them, putting out flames, propping up falling walls and sides of drifts half filled in places with *débris* from the roofs. Such a battle in the recesses of a mine equals, and indeed surpasses, in elements of danger and heroism the fiercest fire battle that men ever waged on the surface of the earth. They played streams of water all day upon red-hot rock and into boiling lakes, and the water ran at scalding heat from the giant pumps. Sudden caves drove poisonous gases upon them; they were paralyzed by fumes of sulphur, antimony, and other minerals, and were sent up the

still smoking shaft, whose heavy timbers fortunately had not been destroyed.

After thirty hours of continuous labour the firemen and miners recovered twenty-three bodies. The fire broke out again and again, with new jets of deadly gas; it became evident that no life remained in the ruins, and at last, after several days and nights of unavailing struggle in the three mines, the mouths of the shafts were hermetically sealed and steam was forced into them with all the force of the giant engines. Two days later the shafts were opened and more bodies found, but the fire broke out, and the mines were again sealed. This alternation continued several times, for the whole mining community was determined to recover every body; but the firemen were brought up insensible, even seventy-five days after the first outbreak of the fire. The miners at last walled up the smouldering fire on the eight-hundred-foot levels of Kentuck and Crown Point, where it continued to burn for a year or more. It is a well-authenticated fact that three years afterward there was still red-hot rock in some of these drifts.

The scenes that occurred in the mine when the fire broke out were graphically told in the Territorial Enterprise and other newspapers, whose reporters interviewed every man who escaped in the first cage load before smoke and gas had filled the shaft. The story reads like a leaf from the destruction of Pompeii—darkness, smoke, ashes, rains of fire, fatal vapours asphyxiating the panic-stricken people of the submontanic city. The Crown Point miners crowded in the cage, where they hung to every bar in such wild confusion that the station keeper thought many of them would be torn to pieces, and so held the cage until it had only time to escape, remaining behind himself

and losing his life. One miner, hastening toward the shaft in the total darkness, all lights having been put out by gas explosions, dropped on his knees and began to crawl forward till he was at the edge of the shaft. Several other miners ran up from behind, and he heard them fall headlong into the deeps.

Outside, the scenes that occurred as bodies were brought out of the volcano mouth, and, most of all, when the order to seal the shafts was given, were such as abide in one's memory for a lifetime. Wives, children, fathers, mothers, friends of the doomed men were all there, adding their separate passions to the awful grief and despair. Some wept, some wrung their hands and cried aloud, some appeared as if suddenly insane or stupefied and overwhelmed by the calamity. Now and then a woman fainted and was carried home by her friends, and ever the crowd grew as the more remote cottages of the miners poured forth wild women hurrying from washtubs and housework to where the black smoke rolled forth, a sign to the cities of the lode that precious human lives were being lost in that vast dædalian labyrinth a thousand feet below. As each body was carried out, a wailing cry rang through the crowd like the winter wind in Sierra pines: "Who is it?" "Who is it this time?" Then the wives of the missing miners came forward to look, and some one shrieked recognition, and those that carried the dead sobbed as they turned back for another.

Later there were other fires. Explosions shook the solid earth and hurled sheets of flame two thousand feet along the drifts from mine to mine. Scorched bodies were found beside the fire track, but miners in the cross-cuts escaped. Again, some months afterward, the Belcher air shaft caught fire. The men were got out of the mine, but gas explosions that were heard

a mile off and spurts of flame five hundred feet high warned the superintendent that the drifts must be closed or the whole mine would soon be a mass of flames. He called for eighteen unmarried volunteers for a desperate undertaking, and had great difficulty in choosing among those that came forward. They were hastily bulkheading the main drift near the burning shaft when a large cave in the latter changed the direction of the draught, and instantly a breaker of white flame rolled forward through the drift. Nine of the eighteen men "were hoisted out scarred and crisp, their clothes burned from their bodies." A second gang of volunteers took the place of the first and completed the bulkhead.

A remarkable struggle for life occurred in the Succor mine, a little off the Comstock, on the Silver City grade. Some miners who wished to "thaw out" their frozen giant powder put a dozen cartridges on the engine boilers and went away. Pretty soon the cartridges began to burn, throwing out jets of flame that rose to the woodwork, and so the hoisting works blazed up in a moment. The mine was a small one, and little work was being done at the time; two men were down in the shaft, five hundred feet below, and the hoisting tub was there also. The car man and engineer shouted to the men and shook the cable, but failed to make them understand that they were in great peril. Then the fire drove everybody out of the building. It was soon in flames and fell in, and the timbers of the shaft itself began to ignite. Of course every one knew that there was no hope after that for the men below, who could not escape suffocation. But two days later, when the fire was put out and a gang of miners went down, they found the bodies of the two men "at the pump station," a recess in the side of the shaft. They had

actually climbed two hundred and sixty-five feet by clinging like snails to the corner timbers and slight crevices. Foot by foot their marvellous journey was traced, and it still remains an unequalled feat in the annals of mining. They were in perfect safety in the sheltered alcove until the poisonous gas from the burning pine rose to that point and destroyed them. A polite coroner's jury a few days later said: "We must strongly deprecate the custom prevalent in many mines of warming giant powder on the boilers about the works."

The spirit in which the miners meet peril and death is almost uniformly the cool, careless fatalism of many a war veteran. Some of their grim jests still ring like the sayings of old Norse sea kings. A premature blast in one of the mines once drove a foot-long splinter through the hand of a timber man, through the lagging he was working on, and into the soft rock. "We shan't need a spragg at this end, Bill!" was his cool remark. A "spragg," be it understood, is a square stick of wood six or eight inches long. One end is put against the posts of the timbering; the other end, slightly sharpened, is against the heavy planks, called lagging. The pressure of the walls upon the planks gradually forces them out, and the spraggs go steadily through into the rock behind. When the planks reach the post the men in charge take picks, relieve the pressure, and put in new spraggs. This system keeps the main timbers from being broken.

A still more famous case of nerve was furnished by a brawny young Cornishman who fell into a main shaft. Twenty feet down he came to the pump station out of which the old-style pump "bob-nose" projected a little, and by agility, strength, and good fortune he was enabled to seize it with both hands, and so

hung over the shaft, swinging from the slippery iron. He made no outcry, knowing that he had been seen to fall and that men would look down the shaft. When a bucket was lowered and he was brought up he cast a careless glance over his shoulder as he walked off and said: "If ee ha'nt caught hold of the bob ee'd ha' been scattered all abroad by now!"

We have thus studied the toils and adventures of the citizens of the real Comstock, the men of shafts, drifts, winzes, and ore chambers. This strange hidden realm begins to take shape in one's mind. It is truly a city, but it is not like the cities of the surface, nor can it be even measurably described by the terms and phrases that apply to such cities. If the California and Consolidated Virginia mines could be taken out of the great lode and set on a plain, they would cover a parallelogram thirteen hundred and ten feet one way and about three thousand feet the other. The height to which they would rise would be over three thousand feet. Through the mass around and within it one would see so many galleries and pathways that to remove the whole body of material piecemeal would seem easier than to construct a tithe of them. Everywhere there are angles, curves, and irregularities, as veins of ore have been followed. Everywhere the mass of soft, mineralized matter mingled with hardest rock is bored, patched together, upheld by braces, and kept from instant collapse. These mines, moreover, are only two out of many. The whole lode, if plucked forth by the roots, would present similar characteristics, and, more than this, it would lean like the Pisan tower, and the sides would run in and out like a toppling, wave-worn cliff full of coves and promontories.

But the Comstock seems to me a more impressive fact just as it stands, walled in by mountains and rooted

so deep that men may toil there through centuries to come without reaching the bottom of its "fissure vein." After meditating upon the paths, lanes, alleys, roads, crossroads, and highways of the great group of mines, rising by stairs on stairs, from level to level, one is ready to grasp the completed conception of the labyrinthian wilderness, where, in the midst of abandoned acres of caves, pitfalls, and jungles of fungi-overgrown timbers, lie masses of ore and yet-undiscovered bonanzas.

Imagine, then, a city built by fallen angels or by the jinn and genii of Arabian legend. They have riven the Himalayas, the roof-ridge of the world, and in the vast cleft they have builded with stones and metals, cell by cell, as the honeybee builds. Millions of years the dwellers have toiled until the cleft, from palm-land levels to where deodars grow in the edges of snow drifts, is full and running over. At last the kingdom of the genii is overthrown by some superhuman hero. Wrathfully, then, the defeated ones rain fire and molten rock down the Himalayan cleft, pile mountains overhead, and pass, black-winged, out of sight forever! Still, traditions of the wondrous city live on in singers' tales, mingled with stories of heroes and the gods in their high places; still, men's imaginations cling to the legend. Then, in the fulness of time, treasure-seekers come, tracking up a barren cañon the faint spatter of molten drops blown from towers of gold in the wondrous city's conflagration. They tunnel into the cleft, they sink shafts into measureless depths, still molten with rains of fire, until they find and empty the palace rooms of the princes and monarchs of a race that existed before the generations of men.

CHAPTER XX.

THE MINING COMMUNITY.

GREATER than the city are the dwellers therein; finer than all incidents and illustrations of the magnitude and material wealth of the Comstock, are lessons of human faith, courage, and ability to conquer every obstacle, that are taught by the story of the mines. For a period of time as long as an average life the famous group has been training men to be miners; has been creating specialized types of character in the midst of a peculiarly courageous and intelligent community.

Along the Comstock, year after year, the bonds of common interest and sectional pride drew men closer together in spite of strenuous rivalries. Periods of bonanza replaced pioneer cabins with edifices of brick and stone, terraced upon the hillsides. Periods of borrasca welded social ties among those whose fortunes were inseparable from that of the Comstock, even as a trip hammer unites steel blooms into armour-plates for girding iron leviathans of war. Men, women, and children learned to love the keen excitements, the splendid physical activities, the perpetual outpourings of energy, the virile, superb, passionate life of the mining camp.

Everywhere, almost unheeded, in the bustling, restless community, were the hidden elements of literature, but, strangely enough, no world-famous tale of the Comstock has yet sprung from the fertile soil. Here

and there a few Californians have attempted to picture the changing life of early Nevada before it passed away, and brilliant local writers have photographed episodes and single characters. But no great novelist seems to have recognised the preciousness of the fast-passing opportunity. Some day the story-teller will come who can add another masterpiece to literature, as one long dead but not forgotten once went to a crumbling adobe house and a poor, despised race, and there wrote *Ramona*.

Said a man who knew and loved the Comstocker: "The person who only judges from the exterior has no business in the camp. He will be picked up a little too often for pleasure if not set down a little too heavily for comfort. A man can have any game he wants, whether played with a pack of cards or with pistols, whether straight from the shoulder, or in kindness from the heart." Dr. Gally can also be called as witness to the characteristics of the men of these and other mountain camps: "They are not good people in the Sunday-school view, but there is a spirit of charity and a Saxon sense of fair play about them which is a substitute. A deliberate insult to a woman or a child is a bid for instant death, and the general verdict is, 'Served him right!' But no man here is any other able-bodied person's guardian. Whoever wishes to go to the dogs, goes to the dogs. There is no restraint, or, as they express it, 'There is nobody holding you.'"

Mining camps, large and small, openly wear their worst side out. Whatever vice exists is open to the sun. With much that is evil, there is also much that is noble, and even heroic. Meanness is very scarce, and shams of any sort are instantly punctured. "What do you know?" is a common morning salutation, and "What can you do?" expresses the habitual attitude of the

camp toward every stranger. Everywhere among this great and peculiar race of men one finds a graphic, broadly humorous, or quaintly burlesque use of words; never in any part of the world has language been more perfectly fitted to daily needs. Here are grotesque idioms and ancient yet living dialects; here, also, is Shakespeare's English, new-minted by the men of the camp into homely phrases that have become American. The frontiersman is here, but the backwoodsman has been eliminated. One notices with surprise that these men, and in fact all others in the camp, seem endowed with an undismayed spirit of humorous buoyancy, curiously common here to all temperaments, climatic, consonant with the clearness, dryness, and purity of the atmosphere, and yet so individualized as to be full of a rare and inexpressible charm.

As for the workers in and about the mines, the minutely classified body of men that form the real nucleus of the camp and give it these distinctive features, no other group of men in America are more compactly organized, none show a keener intelligence, and none are deeper-chested, stronger-limbed mountaineers. Their abounding vitality and cool, steady courage (in the mining-camp term, "sand") have received abundant illustration in the preceding pages, but nothing has been said of their love and tenderness for each other in times of need. Men become "pardes," and each one lives for the other, willing to die for him if there is a chance, and that may come at any moment. They take care of the sick with the gentleness and patience of trained hospital nurses. It is a heroic fellowship at its best—the social order of this masterful, masculine community.

The underground miner as he goes about the street is a well-dressed, clean person, who takes a

daily bath and changes his clothing twice a day—once when his shift goes on, and once when it comes off. He is calmly proud of his occupation, in the purely professional spirit, but personally he is as modest a man as one could wish to see; it is not at all his fault that he is in his way an aristocrat among working men. His life has made him a sane, thoughtful, responsible person as far as mining goes, no matter how lawless of social conventions he may choose to be in other directions. He knows himself responsible for the lives of his fellow-workmen; his own life hangs upon the honesty of another's work, and that other's life hangs upon the honesty of his own work. A single careless prop, a defective bolt or timber, any neglect or lack of thoroughness, any laziness or ignorance, is sure to bring calamity, and may bring death. Therefore this responsible professional personage is as stern as Rhadamanthus in his judgments upon all that pertains to his business.

No incompetent foreman can govern such men. In a great fire at Crown Point, Senator John P. Jones, then superintendent, found it necessary to cut a pipe on the seven-hundred-foot level. It was midnight, and almost continuously for five days and nights he had been foremost in leading the dripping firemen and half-naked miners through smoking, flaming, steaming drifts. Jones and a young man went alone into the level to drive a plate of steel through the pipe. They worked for fifteen minutes in an atmosphere so deadly that the lights almost failed them, and the miner could hardly hold the plate. The lights went out as the last stroke fell, and Jones carried his fainting, half-delirious assistant to the main shaft and held him during the ascent. When the hoisting room was reached he dropped his burden on the floor and staggered blindly

to a bunk. Such were the leaders of the Comstock miners.

One can hardly understand the curious ebb and flow of mining life in its mingling of admirable reserve with dangerous turbulence without long meditation upon that troglodytic existence often so singularly barren of colour and variety, and yet so inexorable in its demands upon heart, hand, and brain. Men might toil with dull persistency for months in a dark, dripping vault, picking down a wall and wheeling out rock; one twist of the pick might fill the drift with a foaming, resistless river of water. The divine elements of mystery and passion were forever hovering near them. Thus miners become, in the course of years of toil, magnificent examples of the power of such environment to stimulate the emotions and intellects of labourers, and to produce a people with vast capacities for love and hate, for sarcasm and laughter, for terrible wrath and for sublime self-sacrifice.

From the most ancient times, says Gamboa, the toils of the mine have been a punishment for slaves, a torment for martyrs, a means of revenge for tyrants. The Belgians purposely called the mining shaft "*la fosse*," the grave, and the Cornish pits were named "coffins." This dreary and exhausting employment makes men long for amusement; they become reckless and yield to the strong and coarse temptations of mining towns. The staples of leisure-hour existence mean to thousands deep drinking and high gaming. The vast fortunes made and lost in mining stocks, and the fluctuations in real values of the mines themselves, insensibly warp the judgment and make the whole community restless, eager, ever anxious for sudden gains. A leading Comstock mine owner once said that he "did not mind what wages he paid his men,"

for "all the surplus" came back to him in his stock deals.

The simple, childlike men of the mining camps were quickly stirred for good or evil. During the war the "sanitary flour sack" of Nevada became historic. It began its career in an outside camp where an election bet was made that the loser should carry a fifty-pound sack of flour through the town and donate it to the Sanitary Commission. Gridley, to whom this fate befel, put the sack up at auction, and \$4,539 in gold was realized. He then took it and started, in May, 1864, on a tour of the Pacific coast. When the famous sack reached the Comstock, Mark Twain and Tom Fitch made speeches, and the towns on the lode took a holiday. Gridley, covered with flags, the sack of flour on his shoulder, walked through the streets, escorted by brass bands, military companies, carriages, horsemen, and the multitude. Silver City invested \$1,800. Gold Hill poured out \$6,587, and when Gridley reached Virginia City and mounted the platform with his wondrous sack the miners were determined to "play the game for all it was worth." The Chollar miners, through their spokesman, offered \$500; Potosi miners raised them, and so it rose by hundred-dollar leaps, as group after group entered the contest, till the Gould and Curry miners, to use their own phrase, "lifted the rest of the boys out of their boots" by paying \$3,500 in cash. Coin rattled like hail on the platform until nearly \$14,000 was raised. Men climbed over chairs and emptied their pockets before Gridley. According to the Territorial Enterprise, a "small brown bug" crawling on a man's arm was caught, put up at auction, and sold for ten dollars for the Sanitary Fund, as a sort of side-show, while Gridley was still auctioning off his flour. A person who jeered irreverently

at the bug, and also suggested that the money "had better be given straight," was immediately thrashed by an irate miner.

Nothing in the long story of the Comstock surpassed the outburst of delight that took place upon the surrender of Lee. The people "went wild in a frenzy of emotion." Said one of the newspapers: "No such drinking was ever before seen anywhere. In three hours the majority of the men of the city were crazy drunk, including many who were never before under the influence of liquor, and were to be seen lying in heaps. Business was entirely suspended, and the printers, editors, and reporters being all drunk, no papers were issued." Mark Twain himself could not invent a more unique, plausible, and all-sufficient editorial excuse for not coming out on time. Rabelais in all his madcap revels never depicted such "high old times" as Virginia City saw that day. Men left the saloons and walked the streets, drinking the healths of the war heroes and of the war President until the last reveller sank into maudlin sleep. A few days later came the news of the assassination of Lincoln. Then the men of the Comstock wept like children and draped their houses and stores in black. Seizing a man who muttered approval of the deed, they gave him thirty lashes on the bare back, and were with great difficulty restrained from hanging him.

Newspapers were very numerous in the Nevada mining camps. Scores of brilliant and audacious writers entered the new fields with able publications whose scattered files will always remain the best contemporary record, and often the only one, of many a forgotten district long since abandoned to primeval silence. The support that these journals received was surprisingly liberal, and while the camps were pros-

perous they were bonanzas to their fortunate owners. Before the Big Bonanza was exhausted more than a hundred different newspapers had been started in the scattered towns of Nevada, whose population was only sixty thousand people. "Along the shore where these dismantled journals were driven by adverse winds," writes one of the pioneer editors, "are buried many absurd, strange, wonderful, and often tragic experiences." A few, a very few, of the old-time editors survive, in a world as remote from their thoughts and training as the thickly settled, railroad-gridironed Sacramento Valley is remote from one of the white-haired trappers of Siskiyou. Some of them, winning a wider fame, left the Comstock, or Reese River, or White Pine, decades ago; others, tired of the "festive pistol's popping" and "a man for breakfast every morning," have learned to plant orchards and vineyards in the California valleys, and so lengthened their days after the long service of pioneer journalism.

Hard and ceaseless that service was. Into every new camp some wandering editor-printer went with his press, types, and outfit, was noisily welcomed by the miners, turned his mule loose on the hillside, and began to pencil his announcement for the first issue of the Prospect, Miner, Argent, Silver State, True Fissure, Reveille, Messenger, or whatever he chose to call the new venture. The Silver Bend Reporter, started in such a manner, in 1867, at a frontier mining village in a rocky cañon of Nye County, announced its advent in language that was there considered a model of the dignified style of salutatory: "Here, in this bright offshoot of civilization, surrounded by a vast ocean of wilderness, shall be a newspaper! In young, vigorous, and beautiful Belmont we have settled." The Territorial Enterprise, the pioneer newspaper of the region,

had five men on the editorial staff and twenty-two compositors. Five hundred dollars a month was the salary of the managing editor. Mark Twain and Dan De Quille were reporters. About this time Tom Fitch, of the Union, challenged Joe Goodman, of the Enterprise, to a duel in Six-Mile Cañon. Mark Twain recorded his disappointment in the next issue: "Young Wilson and ourselves at once mounted a couple of fast horses and followed in their wake at the rate of a mile a minute, since when, being neither iron-clad nor half-soled, we enjoy more real comfort in standing up than in sitting down. But we lost our bloody item, for Marshall Perry arrived early with a detachment of constables, and Deputy-Sheriff Blodgett came with a lot of blarsted sub-sheriffs, and these miserable, meddling whelps arrested the whole party and marched them back to town."

Columns of this sort of thing could be culled from the pioneer newspapers of the Comstock in the days of their glory, when their laughing and fighting writers were the most virile, rollicking, merciless, tender-hearted quill-drivers in America. R. M. Daggett, Henry Mighels, of Carson, Myron Angel, J. T. Goodman, and D. E. McCarthy were among the most famous Nevada editors of the period, and nearly all of them belong to the Comstock group of newspapers, where they first exhibited their high literary abilities. A little later, while these veterans were still in harness and a younger group of writers—such as Sam Davis and Arthur McEwen—were becoming known, the press of Nevada contained more real Pacific-coast literature and gave its writers more freedom of expression than did the newspapers of California and Oregon put together.

A pioneer newspaper office early in the '60's is de-

scribed as a rickety one-story frame building about twenty feet wide. It contained an old-style Washington press, cases, desks, and editor's table. A small lean-to addition was the kitchen and dining room, and sleeping-bunks like those in a ship's fore-castle occupied one side. On cold winter nights the stove was made red-hot, and the printers moved as close to it as possible and "lashed old sacks around their feet with bale rope" to keep themselves warm. When it rained the roof leaked, and the dripping water was led over the cases by strings, so many of which filled the upper part of the roof that it looked as if hung with "webs of Brobdingnagian spiders." Every one, down to the printer's devil, had shares in some favourite mine, and boxes full of specimens lay around in the corners. When a prospector from the desert entered the office, editors and printers dropped their work and gathered around him to listen and ask questions. Many of these pioneer newspaper men had done more or less prospecting themselves.

Stories about Mark Twain, whose brother was Territorial Secretary, are countless in Nevada. He came to Virginia City from another camp, where he had been writing letters signed "Josh." When the first steam press in Nevada started in the Enterprise office, the "general mix-up of new press, newspaper, and bottles of wine" caused Twain to take among other things what he averred was "a severe cold on his mind." He staid at home and one of his chums took his place at the local desk. The next morning the paper contained an article purporting to come from Mark Twain, in which he was made to make an abject and circumstantial apology to a large number of Virginia City newspaper men and other citizens whom he had at various times criticised. This document instantly cured

the "cold on the mind," and Twain, resuming his editorial chair, described its late incumbent as "a reptile endowed with no more intellect, no more cultivation, no more Christian principle than animates and adorns the sportive Jackass rabbit of the Sierras!"

But it was as legislative reporter that Clemens became a shining light of the times. Besides his sober, everyday Senate and Assembly items, he concocted a Third House report which pelted the Legislature with incessant sarcasm. Member after member was made to air his views in a grandiose burlesque of his favourite expressions. After an excellent parody upon Senator Stewart's famous speech against taxing the mines, the president of this mythical Third House responded:

"Take your seat, Bill Stewart! I am not going to sit here and listen to that same old song over and over again. I have been reporting and reporting that infernal speech for the last thirty days, and I want you to understand that you can't play it off any longer. When I want it I will repeat it myself—I know it by heart, anyhow. You and your bed-rock tunnels and your blighted miners' blasted hopes have got to be a sort of nightmare to me, and I won't put up with it any longer."

Thus the humorist dealt undismayed with each individual idiosyncrasy of the legislators, and made them ridiculous throughout the length and breadth of Nevada. When poor Larrowe, of Reese River, returned to his constituency he was everywhere greeted with admiring quotations from the Proceedings of the Third House, such as "Nine sceptred and anointed quartz mills, sir, in Lander County already!" and the terse presidential comment: "Plant yourself, sir! plant yourself! I don't want any more yowling."

Leaving the newspapers, let us again turn to the

mining class. The statistics for 1880 are typical of the working force at a time when it was larger and better organized than at present. At that time there were 2,770 miners employed, of which 770 were Americans, 816 were Irish, 640 were English, 191 were Canadians, 83 were Scotch, and the rest were "from everywhere." Welsh, Swiss, Swedes, Slavonians, Danes, Belgians, French, Australians, Manxmen, Norwegians, Portuguese, and Russians were represented. There was one Finlander and one Laplander. Six more men were married than unmarried. The average age was a fraction over thirty-six; the average height was five feet nine and one fifth inches; the average weight was very close to one hundred and sixty-six pounds. Classified, lastly, according to employment, in thirty-nine distinct occupations in and around the mines, the Americans furnished a majority of the foremen, bosses, engineers, firemen, carpenters, blacksmiths, and machinists. Both the Irish and the English furnished more miners in the technical sense than the Americans did. About eight hundred men in all were needed in the small but important occupations, such as masons, melters, pump men, brakemen, lamp men, and a dozen others; nearly two thousand were miners in the full meaning of the term.

The organizations by which the Comstock miners have maintained wages, have ruled in this respect under all administrations, and still continue to rule, are simply "Unions." At Virginia City, Gold Hill, and Silver City their word long ago became law. On one occasion a superintendent who had attempted to cut wages was concealed in the home of a priest, or he would have been torn limb from limb by the indignant miners. No Chinaman was allowed in the mines under any pretext. As time passed these remarkable Unions,

which had dictated to Stewart and his allies in the days of the earlier bonanzas, reached out to greater victories. When Sharon and the Bank of California syndicate began to build a railroad to Virginia City it was decided to use Chinese labour in grading.

Sharon controlled nearly everything, from the newspapers to the Legislature; but no sooner were his Chinese graders established in a camp near the Overman mine than a committee of three hundred and fifty-nine miners from the Union went out, four abreast, like a military company, in two battalions, and descended on the Chinese. The sheriff of the county ordered them to disperse and return home. One man replied that they would do so as soon as they were through, and advised the official to sit down and watch proceedings. He halted them and read the Riot Act, to which they listened with grave attention until he had finished that impressive document. Then they roared sealike applause, gave three cheers for the "United States of America," and marched on with loud Homeric laughter. As they went along the course of the railroad construction the Chinese deserted pick and shovel and fled into the gulches. Not a shot was fired. The "Committee" returned to report progress, and for eight days not a Chinaman dared to do a stroke of work, while the lordly Sharon was supplicating the Unions to permit the resumption of railroad grading. Finally he signed an agreement by which he removed the Chinese from the districts of Virginia City and Gold Hill.

The wage standard that the Unions insisted upon was not less than four dollars a day for eight hours labour. All workers in the mines, skilled and unskilled, were put on the same arbitrary level. Their one reply to every argument that if cheaper labourers were employed in handling low-grade ores, more men

could be given employment at the higher rates, has been the curt statement, "Pay four dollars a day or shut down the mines."

Four dollars a day was not unusual in the mines of the Pacific coast at the time of the discovery of the Comstock. When the cost of obtaining supplies is taken into consideration, four dollars left the labourer less surplus than two dollars in field work in the accessible valleys of California. As the Comstock lode was developed, only the best miners were employed, and others went to newer districts, thus keeping down the supply. The bonanzas were discovered at such intervals as to give the best mines a large margin of profit, even when paying such wages, and the stockholders, always anxious for immediate returns, were never willing to shut down the mines long enough to secure a new body of working men, even if they could thus break up the Unions and greatly reduce the running expenses of the mines. Indeed, there never was any united effort to reduce wages, so violent and immediate was the revolt against the slightest move in that direction, so strongly were the Unions supported by the whole community. Besides, in many if not all cases the temporary closing of a mine meant the flooding of it with water, and perhaps years of costly efforts to pump it dry again. The Unions held an impregnable fortress.

If there had been no stock market, and if careful business men had been owners of the mines and had held their shares as an investment first, last, and always, no miners' Union or mining community could have prevented readjustment of the amount and the distribution of the wage fund. The Comstock plan, which paid the poorest and the best miners by the same scale of compensation, would have given place to a sliding scale fixed by the employers according to their

ideas of the labour market. The artificial standards of the Union were only made possible by the unique financial history of the great lode; by the millions of dollars in unproductive assessments collected from eager men and women of every rank in life throughout the Pacific-coast States and Territories; by the splendid succession of bonanzas which created in turn the fictitious paper bonanzas of the stock markets; and, lastly, by the great money kings, Stewart, Jones, Sharon, Ralston, Hayward, and the Bonanza Four.

Every observer of the Comstock in its palmy days noted the universally high standards of living. Not only the necessities, but the luxuries of life formed the daily fare of the miners. California and the adjacent valleys sent the choicest fruits, berries, vegetables, milk, fresh butter, and stall-fed beef. Trout, venison, bear, squirrels, quail, and grouse from the Sierras, salmon from the Sacramento, ducks, geese, snipe, and other wild fowl from the sloughs and bays, and oysters from the Chesapeake, were everyday affairs in the Virginia City markets. In 1876 the railroad carried to the two towns in round numbers 400,000 pounds of fish, 350,000 pounds of poultry, 120,000 pounds of oysters, 1,020,000 pounds of eggs, 1,000,000 pounds of vegetables, and over 2,700,000 pounds of fresh fruit. Hams of the best grade to be obtained were a favourite article of food, and nearly 600,000 pounds were used. It is hardly necessary to continue the list. No labourers ever lived on better fare.

The clothing worn by the miners at home and in the streets was substantial and often elegant. Their underwear, white shirts, and shoes were of the grade preferred by the average storekeeper or landowner. The unmarried miners lived in large, well-kept lodging houses, the rooms of which were carpeted, heated,

and comfortable. Bathrooms were universal, not only in the lodging houses but at the hoisting buildings. Board and lodging which cost forty or forty-five dollars per month in bonanza times has been reduced by 1880 to thirty dollars, and even less.

Pay day on the Comstock comes weekly in some classes of work, and the habit of squaring accounts on Monday has grown up among merchants, so that Monday is still called "steamer day," a phrase borrowed from pioneer San Francisco. The regular pay day of the working miners is usually from the first to the third of every month. The men, as they come up out of the mine, go to the timekeeper's office and get their accounts. Then they go to another office, where the cashier or head clerk pays them. In the best Comstock times Consolidated Virginia's monthly pay roll was ninety thousand dollars, and three quarters of a million dollars was paid along the Comstock every month to the employees of the mines. Four dollars a day for workmen counts up fast, and, besides, the engineers, machinists, and a few others received five, six, and even seven dollars a day. The railroad men, the mill men along the Carson River, and the lumberers in the mountains all receive their wages in much the same way as the miners do, and the cities on the lode receive the most of it back again. In many cases every man in a mine leaves a dollar or two with the cashier, when he draws his pay, for the family of some dead comrade; in this way as much as two thousand dollars is sometimes raised in five or six months. This is the miners' life-insurance system.

Chosen as the miners are—the very pick of the mining population of the Pacific slope—they are young and vigorous, but, as vital statistics show, they suffer from pulmonary troubles. This is due to the sudden

change from the tropic lower levels of the mine to the snow-covered, windy ridge of the town in winter. "Many a man," says Mr. Lord, "reached his house half-choked with pneumonia, and spitting blood." The introduction of warm dressing- and waiting-rooms at the hoisting works lessened disease, though the vitality of the miners continued to be sapped by their excessive use of stimulants. Long after the big bonanza days the average annual consumption of beer on the Comstock was fifteen gallons apiece for every resident of the county, and that of spirituous liquors was five gallons. The twenty thousand people spent annually about nine hundred thousand dollars for beer, wine, and ardent drinks. This was called by the saloon men "a dry season," however, for they had seen the average annual consumption of all classes of liquors nearly three times as much.

The remarkable efficiency of the well-fed, well-clothed, and contented miners of the Comstock has been noted in previous chapters. There are no better miners known to the craft, nor can any nationality be said to excel. Working groups are usually made up of men of several nations, for they accomplish more in this manner. In 1877, in the California mine, 217,432 tons of ore were extracted and milled. This, it has been estimated, was a daily average of 1.13 ton for each man employed. The report of the company gave the expenses of that year as follows: Hoisting ore, \$186,461; supplies, \$357,101; salaries and wages, \$788,012—giving a total of \$1,331,574. The 217,432 tons of ore brought up was lifted 1,600 feet and cost at the surface \$6.12 per ton. Mining authorities say that this entire record is without parallel for cheapness and efficiency under the given conditions.

Never were the self-reliance and sheer fighting

capacity of the men of the Comstock better shown than during and just after the great fire of October, 1875. It began at six o'clock in the morning in a low lodging house kept by a woman called "Crazy Kate." Scores of cheap frame buildings surrounded it, everything was like tinder, and a fierce gale was blowing. People roused from sleep had barely time to escape with their lives. The hoisting works lifted men out of the depths as fast as possible, and miners and firemen fought the flames. Vain task! The wind hurled fiery missiles across the city, kindling fresh centres of destruction, while the main torrent rolled on like a lava river from Kilauea, hemming in the defeated toilers. Great brick buildings tumbled, as in the Boston and Chicago fires. The populace, yielding to despair, fled to the mountains and there looked down from barren rocks upon the destruction of Virginia City. Out of the ocean of fire came the roar of explosives as whole masses of buildings were blown to pieces by gunpowder and dynamite stored within, or were blasted out of the way by the heroic men, still fighting as they retreated. Pillars of flame and the mass of dark smoke were seen fifteen miles away. The business houses, public buildings, hotels, banks, churches, freight and passenger depots, and many private residences were in flames when the whole fighting force was centred on the costly mine works. The mountains shook with blasts of dynamite, clearing open spaces about mills and hoisting works, but the fire leaped over in a hundred places at once, caught lumber yards and shaft houses, and swept nearly all the surface works of the mines out of existence in a few moments. Millions of feet of lumber, thousands of cords of wood, trestles, offices, roofs, machinery, inflammable supplies of every description, threw out such

heat that a pile of railroad car-wheels in the open air in the Ophir yards were smelted together. The fire began to creep down the great shafts, and here the miners and firemen struggled in the midst of blazing ruins until the mines themselves and the joint shaft buildings of California and Consolidated Virginia were saved.

About two thousand buildings were destroyed on the lode, and ten million dollars would hardly have replaced the loss. Car loads of cooked provisions, blankets, and other supplies were started toward the Comstock while the fire was still burning. Money was telegraphed. Relief committees were organized in other towns and cities. Lumber was placed on the smoking earth, still being wet by firemen. Electric lights enabled the work of rebuilding to go on by night as well as by day. In sixty days the people of Virginia City were again settled comfortably. An extract from the official report made by the superintendent of Ophir will serve to show the stuff that men were made of in old Comstock days: "On the day after the fire men were sent to Carson and Dutch Flat, California, to procure and ship timbers; machinery was telegraphed for. The new double-reel hoisting engine just completed for the combination shaft of the Chollar-Potosi, Hale and Norcross, and Savage was secured; the old engine foundations were torn out and new ones constructed; work was prosecuted without cessation; supplies hauled a considerable distance on account of the destruction of the railroad tunnel and bridges; the works rebuilt and hoisting through the shaft resumed November 25th, being inside of thirty days from the time of destruction." The new buildings cost nearly \$318,000. Consolidated Virginia and California, which had lost \$1,461,000 by the fire,

replaced everything that was destroyed within fifty days, and yet declared without delay their regular dividends. Consolidated Virginia paid out over two million dollars while rebuilding its works, for it was in bonanza. These were extraordinary and indeed unprecedented feats of labour and capital. The city of mines had come out gloriously under the fire test.

Such were the workmen, such the communities, that once clustered in the rocky waste on the mountains of Nevada. They are still the same, though since the Big Bonanza was worked out the mines have paid their owners poorly, and the towns have suffered much more than in any former period of borrasca. Small stockholders no longer carry the burden of assessments as formerly, but a few large owners have been forced to prop up the fallen market and sustain by their own wealth the daring and still alluring speculation. None except themselves can say how many more millions of dollars these men will or can spend in the search. What new problems are to be solved in deeps below deeps, what magnificent metalliferous deposits may rest undiscovered in the great fissure, no human prophecy can foretell.

CHAPTER XXI.

THE COMSTOCK AS IT IS.

THUS far, the story has been a straightforward narrative of events, from the days of the trappers to the exhaustion of the Big Bonanza. Those Titans whose plots and counterplots shook half a continent are dead, or have forever left the Comstock. We have fallen upon dark and narrow times, and yet, like a ship long beating up some iron coast against unfriendly winds, each headland we round may prove to be the last cape that shuts us out from another prosperous voyage. The spirit of the true mining men was never so clearly present as it has been through the lesser episodes of these sixteen weary years of the Silence of the Comstock.

"She has another word to say. She is asleep, but not dead." Thus spoke incarnate poetry to me from the lips of one of the ancients as I stood on a gray waste pile, looking out over the barren land. The story ends with a question—"What next?" Is it to become a land without a habitation, a mountain of ruins like the ancient city forts of those unrecorded miners of Mashonaland and the Golden Chersonese?

If thus it was now ended, how very far from a new story it is when all is told. Nothing among the deeds of gold-hungry men and wandering races of conquerors could be less strange than this, and yet it covers so large a space as to become almost an epic. Over and

over again, great busy camps, becoming strangely silent, have perished as frosted leaves. The cities the miner has built—who shall name or number them? They are hidden in trackless deserts, luring generations of prospectors to their deaths; they lie among Andes and Himalayas, under glaciers, in tangled Cambodian forests, or, deeper still, where lost continents are sunk in ocean's dreamless ooze. Not yet has that hour of doom and oblivion arrived for the proud Comstock, but the sceptre has already passed to younger camps.

Visit with me the Comstock, then, in this year of grace 1896 and let us briefly note the condition of affairs. We climb with the railroad from well-watered Carson's sea-green circle, through wild gorges and along the crest of ridges that look down upon thousands of prospect holes. Every moment the view broadens and brightens. We climb through a barren, lonely, forsaken land of strange, shining grays and browns, clear cut in a marvellously invigorating mountain atmosphere. The desert slopes endlessly away from the eternal mountains, and a soft, golden glow, like that which pervades one of Gérôme's Egyptian paintings lingers in the far east, across the yellow sands, the silver sage brush. High peaks, treeless even to their deepest cañons, cold, severe, and yet so wonderfully chiselled and rounded that the heart leaps to behold them, are ranged about the amphitheatre wherein the cities of the Comstock were founded thirty-seven years ago. All is revealed in successive landscapes, as the railroad carries one upward from the valley floor of the Carson—itself a high plateau—toward these cities in the clouds, still strong and patient, still able to endure until the end.

A little space farther and higher, and the train

swings along the side of that old-time Slippery Gulch, down which the pioneers slid on rainy mornings, as they climbed painfully, with more or less reprehensible language, to their new-found placers on Gold Hill. There, in the hollow and cañon-crossed head of the gulch, and on its precipitous sides, so steep that as one explores the outlying streets his hand almost touches the rise of the hill, the city of Gold Hill abides, and all the world-famous South End mines of the Comstock honeycomb the vein beneath it.

Although Gold Hill played a minor part in the great trilogy of the Comstock, it shows, even more than Virginia City, that most striking feature of the true Western mining camp, the adoption of the natural surface of the earth, no matter how steep, rocky, or difficult of access, as good enough to build upon. A little levelling may have been necessary to keep streets and buildings from rolling to the bottom of the gulches, but as soon as the stern requirements of the law of gravity were to some extent satisfied the pioneers ceased the struggle. Every inch of ground that a house can be made to cling to is occupied, and the roof of one line of dwellings is often on a level with the basements of the next higher row. So strenuously have men seized upon and utilized every point of vantage that the houses seem piled on top of one another in the centre of the town, while outside scattered dwellings climb the ridges like human beings, leaning forward against the slope and resting in groups. One sees in such an old mining camp so much that seems to subvert the ordinary laws of architectural stability, so many leaning towers and walls, that he is fain to believe that the whole mass of the town is in reality bolted and iron-plated together and fastened to the mountain slopes. In the deep horseshoe-shaped

quarry pit a mile across that by some curious misnomer was called Gold Hill, neighbour can talk to neighbour almost as in a theatre, so wonderfully do whole streets and blocks of buildings overhang those beneath them.

This Gold Hill, this irregular and immense mass of overcrowded structures, some of rough-hewn black timbers, some costly and pretentious, but all mingling with and actually jostling the shanties; these sheds, barns, and rude cheap cottages; these bits of fence and sidewalk; these crumbling steps leading from street to street and from house to house, fitter for goats than for human beings; these black chimneys, piles of rusting machinery, high-roofed mills, and acres of white and brown dump heaps encroaching on the town or sloping away into gulches—all give one a vivid impression of what life was in the days when the place was crowded to the brim. In those days it was not a city in fact, nor yet a town; it was simply one great communal dwelling or primitive apartment house. It still has a communal aspect, for the lessening population retires year by year from the outskirts, leaving shanty after shanty to rot there, and occupies the better buildings.

The railroad carries us through the Divide a few hundred yards, and the last and greatest panorama of the Comstock chain instantly sweeps into view. Sugar Loaf and the Flowery Range are fully revealed, the North End mines and the historic metropolis of the silver miners lie spread out on an irregular sloping mound broken by ravines and hollows, rising to the mountains of granite on the west, and sinking into vast cañons east. It is larger than Gold Hill, and slowly becomes more impressive, though not so immediately picturesque. It lies marvellously open to all the

winds that blow, and they seem to gather here from the western half of the continent. The city is a forest of chimney pots of all shapes and sizes and every conceivable manner of patent, aimed at circumventing winds of every sort, even perpendicular ones. Here ends, almost in the heart of the town, this mountain railroad flung out into a wilderness of rocks for the sake of the silver mines, just as in California a broad, superb stage road is flung twenty-six miles out into the Coast Range to carry passengers to the Lick Observatory, on the top of Mount Hamilton.

What is the visitor's first impression, supposing that he knows the past of the Comstock? Not disappointment, but a poignant regret, almost strong enough to be called a personal sorrow. Wreck, decay, abandonment, make the dominant note of the scene. Many of the great mills stand idle over their vast gray waste heaps, rotting slowly down to death and chaos. Inside, the stamps hang rusting in long rows, "hung up," as the miners say. No clang and clatter is heard—no strong, deep roar of the massive machinery that filled the cañons and the crowded streets in bonanza times with constant undercurrents of thrilling, pulsing sound night and day alike while millions of dollars' worth of bullion poured out of the smelters.

The catastrophe—for it is nothing less—does not seem to attract any one's serious attention, hardly becomes formulated into a casual phrase. One is told elsewhere that "times are dull on the Comstock," that Virginia City "is not what it used to be." One hears on the Comstock itself that "after a little things will pick up"; that there is plenty of good rock down in the mines; that the trouble is with "the ring"—the speculators who are trying to control something or

other; that pretty soon the lower levels will be pumped out, and work resumed in that most torrid mining belt known to modern science; that matters are nearly ready for a great simultaneous revival of enthusiasm. Nor is this merely the despairing cry of unacknowledged defeat; it is something almost too sacred to be put into words. It is neither more nor less, in its higher manifestations, than the sublime spirit of patriotism, defending to the last the lonely mountain fortress of the miner State of the Comstock. These men and women who built Gold Hill and Virginia are unconsciously loyal to something that never took visible form in the chain of American institutional development. The township, county, and political state have not become as living realities to them as the laws, customs, and social order of the Comstock. The cheerfulness and even buoyancy, therefore, with which the community as a whole maintains itself is something that passes human understanding.

I stood and watched a man at the ore heap in a mill. He was a very strong, tall man, blond-bearded, with flakes of gray in his hair; a kindly, sweet-tempered mountaineer, and he knew the mill and mines as a child knows the rooms of the house in which he lives. "Our mine is doing a little better," he said with a smile of pleasure. "They think up at Ophir that they'll strike it rich before any one else, but maybe they're mistaken about that."

Everywhere the same *esprit du corps* exists; it goes far to explain the victories of the Comstock. Everywhere, in spite of the real decay and wasting plant of many enterprises, things are kept in some degree prepared for the expected revival of mining interests. In outward appearances, the community has fallen upon hopelessly hard times; but the potential capacity of

mines and mills is still enormous, and if large bodies of pay ore were uncovered the really important properties would almost instantly resume work at full speed. After twenty years of borrasca, an air of constant readiness still pervades every department. The boys that sharpen drills, the bosses and surveyors and superintendents, all dwell in this hopeful atmosphere and knit themselves closer and closer to the thoughts of the unknown mine depths.

Even while this chapter was being written these unconquerable Comstockers made a discovery that may prove a new bonanza. In previous chapters the formation of the chain of mines has been described. In the chapter on Sutro Tunnel it was explained that many ledges were cut by that great adit, and that some of these ledges might prove valuable. As it happens, there is a wide ledge of rock, rich in a few places on the surface, that lies east of and parallel to the Comstock, the centre ridges of both lodes being perhaps a mile apart, and the lodes possibly uniting somewhere in the depths. The long-neglected ledge, the Brunswick, will now be thoroughly explored from end to end—a work of many months. Ore now taken out of a three-foot vein in the extension of Chollar and in Hale and Norcross territory is very rich, and much resembles Comstock ore. Being drained at a depth of 1,600 feet by the Sutro Tunnel, water can be handled cheaply should bonanzas exist in the Brunswick, and it is possible that in a few years a fourth line of deep-mine works will be built far east, beyond the long-neglected third line of shafts.

The future is a “sealed seed plot,” and no one knows what has been sown therein for these great-hearted Comstock miners. But how dramatic a possibility it is, that while all the world is being stirred by

the extraordinary mining events of recent months, not only in America, but in nearly every other country under the sun, the ancient strength of the Comstock is perhaps about to return!

CHAPTER XXII.

THE AMERICAN MINER OF TO-DAY.

THE American miner of to-day is toiling steadily on, in his countless camps, making history more rapidly than ever before. The yield of our mines fluctuates to some extent, but every decade shows enormous gains. According to official statistics, the total value of the mineral products of the United States in the two years 1893 and 1894, the last period for which we have authoritative data, was, in round numbers, \$1,169,000,000. This includes the metals, iron leading in value, with silver, gold, copper, lead, and zinc following in the order named; it also includes fuels, structural materials, abrasive materials, minerals used for chemical purposes, mineral pigments, and many miscellaneous products of our mines.

The vast growth of all departments of American mining industry can be plainly illustrated by a few statistics. In 1845 the entire United States produced but 100 tons of copper; in 1890 a single mine, the Calumet and Hecla of Michigan, produced 26,727 tons; in 1894 the total product of the United States was 158,120 tons. The world-famous Calumet and Hecla has produced over 500,000 tons of copper since its discovery and has paid nearly \$45,000,000 in dividends. In 1825 the lead product of the United States was but 1,500 tons; the notable Illinois and Missouri deposits brought this up to 30,000 tons in 1845, but the annual yield sank to 20,000 tons, and far below,

until Eureka, Leadville, Cœur d'Alêne, and other great groups of mines carried it to the maximum of 1893—some 230,000 tons. Similar illustrations might be given in every other department of mining. As far as civilization is concerned, the iron industry is the most suggestive of all. According to Mr. Birkenbine's monograph on Production of Iron Ores (United States Reports), the approximate total iron product of the world is 57,000,000 tons, of which the United States, ranking by far the first, produces 16,300,000 tons.

Such impressive sum totals may serve to illustrate the greatness of these rapidly developing underground industries. Better, however, are glimpses of a few of the newer American mine groups which are making fortunes for men, especially from the precious metals.

The Cripple Creek district is situated upon some rounded hills from seven to twelve miles southwest of Pike's Peak, Colorado, at an elevation of from 9,000 to 10,800 feet. Some early prospectors organized Mount Pisgah district here in 1874, but failed to handle the ores at a profit. An excitement occurred in 1884, when 5,000 people camped here on "salted" claims. Some of these claims afterward proved to be valuable, though sold on false pretenses. Along in 1890 numbers of tenderfeet, or "alfalfa miners," as the prospectors called them, began to take up claims in the twice-abandoned camps. After a while, by a little stream in the aspen thickets, a lame burro, a dog with a broken leg, and a man with a broken arm are said to have given the chief camp its name. Notable discoveries were soon made, changing penniless men into millionaires, and by 1894 the Cripple Creek excitement was something wonderful to see.

Cripple Creek mining towns have continued to

grow since then; ten or twelve camps, with a total population of some 25,000, lie within an area of sixteen square miles. Something like a hundred mines are shipping ore to the cyanide-process mills at Florence, on the Arkansas. The mines in 1892 yielded \$600,000; in 1893, \$2,100,000; in 1894, \$3,000,000; and in 1895, nearly \$8,000,000. This one district has made Colorado the leading gold-producing State in the Union, the total output of gold in 1895 being \$17,340,495.

Another district attracting attention is the Mercur of Utah, in the Oquirrh Mountains, where a Government mule, kicking a piece of rock, revealed the gleam of gold to a lucky teamster named Allen. Here, and in the adjacent Tintic range, are rapidly growing camps, producing half the precious metals of Utah.

But perhaps no portion of the great mineral belts of America is being more rapidly developed at present than California, long to some extent neglected, and yet possessing many very famous mines and enormous undeveloped resources. The noted Idaho and Eureka ore body yielded over \$11,000,000 in seventeen years, and paid over \$5,000,000 in dividends. The Hayward, the Keystone, and the Oneida of Amador; the Massachusetts and the Gold Hill of Nevada; the Sierra Buttes; the Plumas Eureka and the Standard Consolidated, are equally familiar names to California gold miners. About eighteen thousand miners are regularly employed in twenty-four hundred well-established mines, in different parts of the State. The Pacific coast north of Mexico, and including Nevada and Arizona, has fully a thousand stamp mills, carrying about fifteen thousand stamps and costing, with other machinery, fully \$20,000,000. Half of this investment is in the State of California.

The American prospector, cheerful and energetic as ever, is at work in hundreds and thousands of once-abandoned camps, whose ledges could not be profitably worked by old methods. He is busy revealing new treasures in the islands of Unga and Unalaska, in camps along the Yukon, in the south-coast Alaskan gold fields, and in British Columbian districts, such as Cassiar, Caribou, and Rossland. Prospectors are searching mile by mile the mountains of Washington, Oregon, and California, all the way down to the Mexican line. The entire length of the great Rocky Mountain mineral belt is being prospected more vigorously than ever before. Only the other day, out in the Mojave desert, a large district was found, where placer gold and rich quartz veins abound and new camps are there being established. One of these is called the Randsburg. As usual, stories of the rediscovery of the long-lost "Gunsight" and "Pegleg" mines come from various parts of the desert. Every issue of the mining journals contains hundreds of items from new camps, illustrating the toils and triumphs of the prospector as he tests surface gravel claims, or tunnels for ancient river channels under lava beds, as in Idaho, or finds in all sorts of unheard-of places the gleam of minerals, useful or precious.

Much has been said in this book about the prospector, and more might justly be added, for he still remains the pioneer, differing in essential details from the miner, the speculator, and the capitalist. He lives a free, careless, outdoor life, and he has blazed the trail for others all the way from Missouri and Texas to Alaska and California. Though better fitted for his work than he was fifty years ago, and better supported by those who make fortunes from his discoveries, the American prospector of to-day has not essentially

changed; he is still a wide traveller, an heroic adventurer, a man of infinite resource and homely, well-trying virtues. Sometimes, like Dick Gird, he reaches a district "with a pair of blankets and six dollars in money," and finds a million-dollar mine; sometimes, like Major Reading, he "loads a train of mules" with gold nuggets from new placers, but far more often than otherwise the wilderness, which takes him to its heart, sweetens his many hardships with such devotion to his chosen work that all his life he searches for hidden treasure, and rarely makes more than his grub stake.

The whole American mining field broadens year by year, not only on the frontier, but in many of the staid and long-settled communities. Perhaps, with improved methods, even the gold deposits of the Appalachians, from Nova Scotia to the Carolinas and Georgia, can be profitably worked on a large scale. The best authorities declare that the cost of roasting and chlorinating ores in a hundred-ton plant is now less than three dollars per ton. By the cyanide process it is even less, in ores adapted to this useful method. A few years ago these processes cost ten dollars and even twenty dollars per ton, but large bodies of low-grade ores, long necessarily neglected, can now be handled with profit.

So promising are recent developments that it would not surprise mining authorities if the annual gold yield of the United States, British Columbia, and Alaska reached the hundred-million-dollar mark by the close of the century; nor does it seem unlikely that the total yield of different countries will add to the world's gold stock within the next ten years more than \$2,500,000,000. A period of higher property values and of larger business prosperity is clearly indicated by this astonishing revival of mining interests. Evidently the story of the miner and his mines will go on for ages to come.

I may say, in closing, that there has never been a time when so many attractive and important books upon mining were being published by specialists. Besides the United States Government Annual and Census Reports and the invaluable volumes of the leading mining and engineering periodicals of America and Europe, I note among recent publications Rothwell's Mineral Industry, Statistical, etc., a masterpiece of work; Eissler's Metallurgy of Gold, largely devoted to new processes; Hatch and Chalmers's Gold Mines of the Rand; and Kemp's Ore Deposits of the United States. Really monumental works upon the history, mechanics, and metallurgy of mining are each year appearing in greater numbers. The noble industry of which I have given only a glimpse is in the hands of highly trained specialists, and everywhere, from the arctic circle to the auriferous conglomerates of South Africa, these specialists are shaping its magnificent future.
